# Is The Bottom Now In For Gold & Silver Prices? | Andy Schectman

**Podcast:** Thoughtful Money

---

# AI Executive Summary

1. Core Thesis: While gold and silver prices have experienced a significant drop over the past year—a correction from speculative highs—the episode argues that the underlying price floor is likely near or already established due to massive, underreported accumulation by sovereign nations (specifically China) and potentially US proxies. Despite Western market suppression via rehypothecation and paper trading, these geopolitical powers are accumulating physical metals aggressively while simultaneously building alternative payment systems backed by tokenized gold. The thesis posits that political shifts toward increased fiscal spending and the increasing fragility of digital/financial infrastructure due to AI hacking make physical gold not just a speculative asset, but a critical component for wealth preservation and price discovery in a new global monetary order.

2. Key Arguments & Data:

3. **Sovereign Accumulation vs. Price Depression:** Central banks and China are accumulating gold at unprecedented rates despite depressed prices (COMEX). China imported nearly 1,100 metric tons (approx. 800k–1.2M oz) in the first eight months of 2026, setting new annualized records over the past decade. The US is suspected to be accumulating via Tether and commercial bank proxies (JP Morgan), bypassing balance sheet transparency through the Exchange Stabilization Fund.
4. **Market Manipulation Mechanics:** Western market prices are suppressed through Comex rehypothecation (paper trading 200x available physical bars) and high-margin rates, designed to mitigate panic among traders while allowing institutions to profit from long positions without actual delivery risk.
5. **Geopolitical Infrastructure Shift:** Hong Kong is launching "Project Ensemble," a system using tokenized central bank money for 4-hour gold bar trading and settlement in Yuan/Dollars (starting Q1 2027). Other nations (UAE, Singapore, Saudi Arabia) are building parallel payment systems to challenge SWIFT.

6. **Political & Fiscal Indicators:** The recent election results suggest a fiscal expansionary government path (Democratic Socialists/Blue Wave), which aligns with historical patterns where increased spending leads to currency devaluation and inflation.
7. **Tech & Security Risks:** The transcript highlights high-frequency AI hacking of digital assets, financial institutions, and critical infrastructure (e.g., Poly Market hack). This reinforces the argument that holding tangible physical assets is an "optionality" hedge against a potential global digital breakdown.
8. **US Gold Reserves Discrepancy:** Official US gold reserves have not been audited since the 1950s/60s, though data suggests they are significantly underestimated compared to active accumulation by the world.

9. **Price Psychology:** The price correction (dropping below 4k) is viewed by hosts as a psychological floor but potentially a manipulation floor intended to keep speculation down until sovereign buying reaches true valuation levels.

10. Actionable Takeaways:

11. **Implement Dollar-Cost Averaging (DCA):** Listeners are advised to acquire precious metals gradually during dips rather than selling out at inflated highs. Accumulating while prices are low increases potential long-term returns as the price recovers toward "real" value.
12. **Optimize Tax Strategies for Commodities:** Unlike securities, the 30-day wash rule does not apply to physical commodities. Listeners can potentially sell metals at a loss (e.g., pre-1965 coins) and repurchase them immediately without triggering a wash sale if possession technically changes hands, allowing for capital loss write-offs against future gains.
13. **Prioritize Physical Assets:** Due to risks associated with digital financial infrastructure (AI hacking, systemic collapse), maintaining a portion of wealth in physically stored commodities is recommended for security and crisis resilience.
14. **Monitor Premium Anomalies:** Watch markets for opportunities like pre-1965 "junk" silver trading below melt value, which offers low-risk

hedging and high value during market dips.

15. **Prepare for Payment System Shifts:** Investors should understand that the US dollar's price-setting power is being challenged by Asian nations settling in gold-backed currencies; this structural shift suggests long-term bullishness for metals regardless of current Western political stability.

# Full Transcript

And we should be live. Welcome to Thoughtful Money. I'm Thoughtful Money founder and your host, Adam Taggart. Welcome you here for one of our regular checkups on all things gold and sober and precious metals related with the CEO and co-founder of Miles Franklin. Of course, I'm talking about Andy Schechtman. Andy, how are you doing? I'm good, Adam. How are you, my man? Thanks for having me. Thank you. Always wonderful having you on, buddy. Thanks for coming on. earlier in the day after an election night. I don't know if you were like me, but I was up pretty late looking at the results and everything coming in. So, thanks for coming. I know you were just jumped off another podcast to be here, which is why we're starting like two minutes late. So, thank you so much for making the time for us. I apologize for being tardy. Yeah, I'm glad to be here. I'm sorry I was late. No, no, no, no. Okay. So, I am...

Tell you every time Andy. I've got to name these live streams before we we actually do them But this one I think maybe I did aptly name given the timing so the title of it is Is the bottom now in for gold and silver prices and I know bottom calling is tough. It's a dangerous game But gold has been trending down pretty much all year, but certainly over the past two months. I mean, almost on a daily and a day for day basis. But I'm going to try to share my screen here real quickly. And let me see if I can share these charts with folks. Gold hit a new all time low for the year a couple of days ago, but it seemed to kind of firm up a little bit. We'd had people like probably yourself, but also Ronnie Stifferly from Ingold We Trust saying his confidence that we were near a capitulation bottom was high. And then after the election, we saw a really big balance in terms of the market's response here. Who knows how long it's going to last for. But let me just pick this up here. So as folks can see over the past couple of days, Gold was trying to find a bottom, kind of had this potentially capitulation low here right before Halloween. Maybe firming up a bit, and then a nice big spike here following the elections back up over 4,000. We have similar action going on in Silver. So, Andy, back to the title of this program. What do you think? It's early, but could a bottom be in here? It could be, and there might be more softness.

I read one of the comments right when I got on I haven't been right all year. I mean in price. I haven't you're right. I mean I'm I'm Fine admitting that price wise I haven't been but it doesn't matter now. Why doesn't it matter at least it doesn't matter in my thinking right because In my thinking so far this year we've had over 81 almost 82 if not higher I haven't looked this week billion dollars and gold delivered to COMEX. We've had pretty darn well near 20 billion in gold or silver delivered to COMEX. We have seen the central banks buy at levels that are unrivaled, pretty nearly unrivaled in the past. We've seen China import record sums in the first eight months over almost 1,100 metric tons.

multiply 1100 times 32,150 ounces, and that's what you get. They bought almost 800,000 ounces in September. And I think that the deliveries and the accumulation as prices have gone lower, to me, betrays the value, betrays the value that we're being led to believe, betrays the price. Let me just kind of lead you through a couple of things, and you can all make your decision yourself. You know, we all talk about silver being classified a critical mineral through the geologic survey reclassification. But in March, through executive order, gold was executive order 14241 was reclassified critical as well. Gold has been added to the critical elements list. This is in addition to it being made a Tier 1 asset with banks through the Basel updates. Correct. I'm going to ask you a question before I finish.

Do you know what was just voted the freest economy in the world by a Canadian think-take? There's a Canadian company called the Frazier Institute. Do you know which was voted the freest economy in the world? Take a guess. Which nation? Yeah, which economy in the world, out of 165 jurisdictions, which one do you think was voted the freest economy by the Canadian Frazier Institute? God, I don't know. I'm gonna go with the who must be America and I'm sure it's wrong because you're asking me this question So right it'd be Hong Kong And it's been voted the world's freest economy first amongst 165 jurisdictions now when you take a look at Hong Kong Let me just tell you what they're doing right now with gold. They just took a major step in in financializing gold And we've talked a lot about the rails that they built, right? We've talked about all the payment systems and all of the settlement systems with or the vaulting systems in our settlement system in Hong Kong in yuan, same day settlement that goes into effect

first quarter, 2027. They just did something called project ensemble. And it's live. They haven't really given all of the details yet, like in terms of the nitty gritty, but.

It supports 24 settlement using tokenized central bank money and there's like up to 20 banks involved in it in Hong Kong, but they have also Advanced the system to now allow 400 ounce gold bars that can be traded and settled digitally between the banks So think about what that means you have all this gold sitting in a vault that now will become Financial collateral it will support lending and financing and transactions around the clock This is going on in Hong Kong at the same time they have all of the rails sips and picks and p a s s and UPI and Embridge and so the one of the things that I've been wrong about in terms you want to say what I've been wrong about I've been wrong about when analyzing the bricks that they would ever dream of having a Unified currency it's not what they're going to do. They do have the the unit settlement currency that just did their first successful transaction between United Arab Emirates in India But what they are doing and where this all comes together with gold is that they have the thrust of the last meeting They just had in September was interoperability Every one of these countries all of these nations have built and have operational cross-border payment systems that run parallel to Swift, but don't cross with it. There are vaults that have been built. Saudi Arabia, United Arab Emirates, same-day settlement, Singapore, same-day settlement, Shanghai, Hong Kong, same-day settlement in yuan and in dollars. Mumbai, we said Mumbai, oh no we didn't, Mumbai. You also have St. Petersburg and Moscow and all of these vaults that are being built through the Belt Road, they're the arteries, the veins or the payment systems.

and they are going to, the whole thrust was interoperability, connecting all of these things through bricks pay and bricks embridge is what they have done and what they will do and gold will be the settlement system. They will use gold to settle in balances and you are seeing that and this is why you're seeing such massive inflows, not only into those countries but massive exports out of Comax, out of the United States to China. Anything that hasn't been nailed down, they're exporting, they're sucking it all over there. And so what they have been doing, along with playing the game with the West, playing the Western suppression, which if the price was indicative

of value, then why are the most well-informed traders in the world buying and taking possession of gold at levels that nobody has ever seen before? They're doing it at the same time they're building the infrastructure to challenge, not to replace, but to challenge the West with an alternative, payment systems.

Payment rails settlement systems all of this is happening right now and so when I look at at the price I Don't get as depressed as a lot of people might otherwise get because I see that you cannot run from mathematics and you cannot run from the economics of this and the logic of it You know, so what when I see 82 billion dollars with the gold go into Comex this year by delivery And the central banks buying at these levels and and reports coming out from Goldman Sachs and the IMF and the World Gold Council that they're all lying about how much they're buying It's actually much more. I don't worry about it at all. I don't I think ultimately the price goes much much higher and if I had to guess and I could be way off base on this I've said this I've had to guess it has been the West that has been suppressing the price because they realized they were behind the eight ball and they needed to accumulate the metal by proxy through the commercial banks and Leave it there. So no one no one even thinks twice while it's sitting in JP Morgan's vault or it's sitting in this one's vault Who cares if it belongs to the Treasury through the exchange stabilization fund who is knocking down the price because they're both critical mineral for national security Well, no one's gonna notice And when it leaves the vaults, like the 39 million ounces that left Comex in February, the silver, everyone freaks out, who just took possession of three million pounds of silver worth four billion dollars? Where did it go? No, let's just leave it there. My guess is price has been used to misdirect everybody across the globe, except the people who understand what it's worth.

And so, yeah, maybe the bottom isn't technically, yes, it's very, very, it's way oversold and it's reached, it's reached some fairly significant technical resistance levels. Could it fall further? Sure. But I would like to think that 4,000 is, you know, kind of the, it's been the resistance forever. I think we're back above 4,000 this morning. If I'm not mistaken, yeah, we are. I'd like to think that's the floor, but who knows, right? Could it be a dead cat? Sure. But in the end, does it matter? It matters, but does it really matter when the

people who make the rules are buying at levels no one has ever seen and no one's talking about it? That even kind of accentuates it more that, yeah, if I had to guess, we're very close to the bottom. But the big money accumulating, it tells you that price is not the ultimate consideration. Okay, so a couple of things. First off, last time you were on, we spent some time sort of on the thought exercise of, you know, the US officially has, what is it, 8,000 tons of gold or something like that? It's over yet. But that number hasn't changed since when? The late 40s? Yep. Well, I know they haven't updated. They haven't audited since 52 or 3. Okay. And I guess I'd say maybe from the 70s because we knew that other countries like France were pulling their gold out before next and shut the gold window. So anyways, you know, it's been on the books forever. We've got about 8000 tons. And as the rest of the world has been buying gold hand over fist, you know, the central banks, we have all this data. And we think that data is undercounted. You know, we should have asked the question, well, okay, Why hasn't the US been buying any gold in that environment? And your answer was hey, they probably are but in the ways that you just mentioned right through proxies maybe keeping it stored JP Morgan whatnot Yes, yes at tether. Yeah, so I mean it does that there is definitely a compelling logic there that the US Wouldn't be asleep at the wheel while everybody else is doing that and at the same time while gold becomes a tier one banking asset, while gold is added to the critical minerals list, you would think if anything's added to the critical minerals list, the government is saying, well, we want to increase our stockpile of that because it is so essential. So I totally get your logic there. I ask you this every time. You have been saying the Chinese buying has been white hot this year. They've been a big buyer in past years, but so far 2026 is their highest buying volume ever. At least in the last 11 years, I think. At least in the last 11 years. It beats the recent data set that we have, and the year's not over yet, so they still have two more years to continue adding to this. As you look back to the past month or so, is the intensity of the buying still maintaining?

or are we seeing any trends that maybe it's starting to cool off? Yeah, I think it is continuing. Typically, the numbers that you see are a little bit behind, a couple months behind. But I think China in the first eight months of the year had imported almost 1,100 metric tons. They added, I believe, 740 or 750,000 ounces in September, which was the 23rd straight month of

accumulation. And again, those import numbers annualized would be the highest amount in 11 years. Now, I haven't seen October numbers yet, but I have no reason to believe that they're not every bit as white hot. And when you look at... Goldman Sachs came out and said their numbers their reporting is is full of you know what because they're buying way more than that We can see it through the import numbers and as I've always said if gold is imported by proxy through the P People's Liberation Army on behalf of the PBOC or a commercial bank. It's not reported It's voluntary reporting to begin with but yeah, just what they have reported They've reported the most on an annualized basis, and over a decade, almost 1,100. Well, if you add in the September numbers, you're at basically 1,200 metric tons of gold. That's just to give you an idea of what that really is, because it doesn't sound like a lot, right? But if you take 1,200 times 32,150, that's 38,580,000 ounces of gold. Let's call it times 4,000.

That's got a e that's 154 billion 320 million dollars worth of gold so far this year is that inconsequential? No, and if it's actually underreported by a large magnitude No, and if they're the largest producers in the world No, it's not inconsequential and then they're building the rails and the payment systems and the vaulting systems quietly to reintegrate Gold into the monetary system and the central banks are doing the same thing and I would ask who is right Who's got this figured out the central banks the Chinese the sovereign buyers major institutions? Or the average Western investor who believes that the road to retirement is only paved with mutual funds and stock certificates I would ask you who has it right? We do know that these banks have been accumulating gold and silver hand over fist and you know And those numbers, according to the IMF, the World Gold Council and Goldman Sachs are massively underreported. Okay, so to a certain extent, China and a number of other countries, and perhaps even the US, are looking at the lower precious metals prices this year and they're leaning into them, right? China for sure, buying at a higher volume. Let me say this, if you have the ability, and again, You know, I look at all of the facts, right? Everything I say up until well, those are facts, but well, I'll say this. If you had the ability, you came to President Trump and said, look, these are national security issues now. We've classified them quietly, scold. We were very loud about silver.

No one know so many people don't even know about that executive order. It's right there It's section two. You can read it one two one four one read it section two gold is critical mineral along with Potash and uranium and copper I think but anyways if you had the ability look mr. President here's what we got to do It's late. They've been doing this for years. They've been beating us at our own game the previous administration didn't get this We're late. We need to step on the futures price right now with the banks. Give them immunity. They need to step on it and use it to quietly stand for delivery. But won't that affect our balance sheet? Yes, Mr. President, you're right. It would. But because the Exchange Stabilization Fund through national security can do this without congressional approval, if we import it through them by proxy by the banks and just leave it, in the Comex account. It won't hit our balance sheet. No one's going to know it will quietly be transitioned to the Treasury at a certain period of time. When is that time? I don't know, but I will say this, when the Chinese start pricing gold contracts and yuan for same-day settlement, the game is over. I mean, I don't know how you can continue to play stupid using these prices.

when they're going to deliver in yuan for same-day settlement they'll say it will be a much higher price and anyone who's stupid enough to give it away at these prices will be arbitraged over by exchange for physical to to Brinks Hong Kong and boom it's over now you you've just siphoned everything over at a subsidized price and the relevancy of the Western price setting is done So can they continue to play this game? Yeah, probably for a little bit longer And maybe that is why we haven't heard who the hell is standing for delivery for two straight years in the in these amounts Because you know if you look at what the exchange stabilization fund their charter, which was I think a built night it was came into existence in 1934 and they can indeed Intervene in currency and gold markets for national security and they don't need congressional approval if it's so so Look, I don't know that to be the fact, but I'll tell you this. Either that or there are some very smart people with a whole hell of a lot of money that are standing for delivery. Because no one ever went this far, they would either roll forward their contracts, they would cash settle or they would leave. They never said, nah, I want the actual physical certificate. It's unsettled for it. Pay the money and settle. And that is exactly what is happening. And that's never happened before in my entire career ever.

And it is non-stop. And the fact that no one asks about it to me even makes it more compelling when the mainstream doesn't say, who's doing? Are you looking for a trusted health insurance? Allianz covers you beyond borders. We deliver peace of mind just a click away with global telehealth access and round the clock support. Backed by 2 million healthcare providers worldwide, we're trusted as the number one insurance brand for the last seven years. Visit AllianzCare.com and explore our Singapore plans to find out more. Terms and conditions apply. Okay, and I've got a great question for you, Andy, but your connection here just froze. So hopefully you're going to unfreeze or log out and log back in if you can hear me here. So the question I'm going to ask Andy folks as soon as he pumps back in here is, okay, so let's say Andy is total forecasting comes to pass. And we have China and its partners in the rest of the world saying, look, we're just going to do trade in this new Goldback trade currency. The US comes out and says, hey, we're not going to be left behind. We're going to use tether and basically the power of these new crypto rails that we've laid down.

to make sure that we get greater control of the world's gold supply. What are the implications for the price in a world like that? And while I'm waiting for Andy to hopefully pop back in here, I know, ironic timing to glitch there. What does he think will happen to price there? Because I think a big question that folks have been asking themselves over this year is, okay, I get that gold prices are slumping because they just... shot the moon at the beginning of this year, and there was a ton of froth and that had to come out. And then real rates have been rising as bond yields have been going up. But if there's so much buying demand going on by massive sovereign players, how come that isn't providing a bigger support to the gold price here? So again, we'll get into that with Andy, hopefully when he joins back in in just a couple of seconds.

So another question I'm going to ask him, which I'll just opine on while we're waiting, which is, okay, so if this is going on and the sovereigns are essentially using this opportunity to say, hey, this is a gift. We're buying this stuff in bulk and the price keeps going down. We're getting a better and better deal. Shouldn't the individual who's paying attention Basically copy that strategy and say look as long as the stuff is that what could be fire sale prices Should I be adding it here over time? As I've recommended and Andy

recommends on this channel very often That you know, folks should be dollar-cost averaging That strategy, you know to the extent gold has just bottomed here, and we don't know yet folks but to the extent it has You know that's going to work out really well in your favor. And so if you are not already dollar cost averaging, there's never really a bad time not to do it, because if you have a long-term horizon, it should work in your favor if there's a rising tide on the price over time. But certainly when the prices are going down like this, yes, it hurts if you've got an existing holding of precious metals that you're watching the total market value begin to drop.

Those are the times where you're really basically accumulating your future value because the lower the price you buy at, the higher your profit is going to be down the road when the price recovers. Alright folks, I'm not sure what happened to Andy there. I hope he's okay. I'm going to try giving him a quick call live on air if you guys don't mind hanging on here with me, but I will also take live questions from the live chat here. So if you have any questions that you want to ask me, feel free to ask. I'm sorry, my friend, what Andy? Was that you? That was you. You somehow kicked out. Can you log back in? I think they're trying to get me. You have to restart. I will say and I'll be right back. All right. I'll keep tap dancing. Thanks. All right, folks. So if you could hear Andy there, he said that things have frozen on his end, but he's rebooting his computer.

he'll hopefully be joining us very quickly. You know, another question I'll ask him, and I'd love to get folks' thoughts on the live chat while we're waiting if possible, is, and really folks, this is not a partisan question. It's really just, it's an honest question given the results of the election last night. And whether you're happy with them or whether you're not happy with them, a Democrat sweep of this magnitude you know, obviously seems to send a signal as to where the mass populace's heads are and a number of the candidates that won, you know, are democratic socialists. And these are people that are, you know, running on platforms of wealth redistribution or, you know, at the very least pretty generous social spending programs. And I'm curious If that's one of the things that the precious metals might be reacting to here, where they think if this is an indicator that 2028 might go the way of those types of candidates, then does the fiscal spending from the government increase even further under that type of administration? And is

gold already starting to predict that? I see Andy here. Let me bring him back in. Andy, brother, thank you for joining us. I think they're trying to silence me, Adam. They're trying to silence me.

Maybe that did. Maybe you were given too much away and the authorities said cut this guy's cord. Yeah, I don't know could be could be. So let's let's jump back and I apologize. And by the way, I can stay as long as you want me to. Alright, thanks. Well, we'll try to contain this still within the hour if we can. It depends how many questions the audience has for you a bit later on. Sure. So a couple questions I flag for folks that I wanted to ask you when you came back. Let's start with the first one. which is, it's just a little bit of a head scratcher still for me. So I totally understand why prices are materially lower than they were in January, right? Because we had, you know, we had a bubble in the precious metal prices then, right? A massive blow off top. Okay, so we've got to get rid of all the froth. Maybe things will overcorrect for a period of time. You know, 11 months is a long period of time to keep correcting, but who knows? Maybe that's just a math. I don't really know. But when you add into that, the prodigious buying of the sovereign nations that we've been talking about at the volumes they're buying at, I just wonder, why doesn't that put more of a floor under the price of gold here?

Are you a little mystified like me that the price hasn't held up better this year? Just simply given the volume of foreign sovereign purchases and perhaps even stealth US purchases or Does the things that kind of happened in the background not well, I mean It is that's totally a fair question, but look at how much gold has gone up Forget about the blow off top right the blow off top. You had massive speculation Comex based speculation That's part of the reason I think they jacked margin rates up so high You had the traders and the hedge funds that jumped in with both feet figure now make lots and lots and lots and lots of money And they did right and then the tables got flipped on them So you know it broke through the cup and handle and often when you break through a cup and handle you see a parabolic move But it comes back to test the handle More or less is what it does and that blow off top Richard Russell used to always say a 50% retracement type of thing is totally normal Silver's gone through that, of course. But gold, a 50% retracement from where you started to where you went is

normal. It blows off all the froth. But I think that the people that paint the taper are very sophisticated in this. I think that they are very, very sophisticated. They understand that if you violate moving averages, if you violate technicals, The majority of all of the Wall Street traders are doing this by black box non emotional algorithmic trading programs that once violated they leave and They've kept it within a trading range showing great volatility that is completely and totally counterintuitive but the the number of The rehypothecation with paper allows this to be controlled to be mitigated the price is mitigated. So by selling short paper, you have tremendous amounts of leverage that enable you to keep the price within a certain range. But even still, I mean, it's averaged over 10% per year for the last 25 years. It's been moving up over the last several 30, 40, 50% per year. The blow off top, you know, you the blow off top, certainly, I think woke up those that have been trying to mitigate their eyes, and they did all they could to not allow that to happen again. And if you were indeed part of a coordinated effort, whether it be the Treasury or the central banks, and I think it largely is the Treasury and the Western entities that have done this forever, the last thing you would want to see are all of the traders jumping in. Now, if you look at what's called open interest, it's as low as it's ever been, meaning The open interest are the hedge funds, the buyers. And by the way, since July, the hedge funds have completely reversed. And they were wickedly long and now they're short. Big short. Who's long? The commercial banks, the ones that probably know where the puck is going. You're going to see the price turn around. But they did a very, very masterful job. Look, if the commercial banks are the ones that have been suppressing the price, maybe even it was they were being told to do it for a reason, The last thing they want to see are all the speculative traders jump in and push the price parabolically higher. They did. They let it go higher. They raised margin 300% as the ETFs rebalanced. They crushed it, and they haven't stopped stepping on it to dishearten, if you will. The managed money and the managed money open interest is the lowest it has been, and I can't even tell you how long. It's like they're like, I don't want to even play in this sandbox right now.

Are you looking for a trusted health insurance? Allianz covers you beyond borders. We deliver peace of mind just a click away with global telehealth access and round-the-clock support. Backed by 2 million healthcare

providers worldwide, we're trusted as the number one insurance brand for the last seven years. Visit AllianzCare.com and explore our Singapore plans to find out more. Terms and conditions apply. And is that because they just got so zorched earlier this year? Well, you would think so after all of these years of getting zorched, you would think that they would just have figured that out a long time ago. But look at the open interest. It's very, very, very low. Not only that, it's very oversold. But the COMEX market is massively rehypothecated. Now, you'll get, I was reading a very interesting article by David Jensen. And David Jensen

I would recommend everyone check him out. I don't know if you've ever interviewed David, but he has I have not massive knowledge on on the LBMA and you know, he was pushing back against a A an interview that was done where the guy was given David a hard time saying well anyone that goes short on comics goes long corresponding physical in London This is how they keep their balance sheet meaning balanced neutral short here long here, but David says look What they are issuing in London is not a one-to-one contract. It is a it is an unallocated claim for physical but these these vaults have operated these these systems in unison have operated under the assumption that very few if any stamp for delivery It's just like the goldsmiths of back in the day Well, no one ever comes to get their gold so we can sell more and more and more and more paper and so the paper overwhelms massively by like 200 they trade over 200 times the amount of available silver on a daily basis in In on Colmex and when you look at the amount of trading that is done It's it's ridiculous. So as an example If I can remember the numbers What I can tell you that the manage money long positions is at their lowest in 52 weeks that I do know But if you look at the actual numbers, I'm almost positive it's over 200 times the amount of available bars that could be delivered, traded every single day on Comax. Well, how do you do that? And in their trading in total, the daily volume is about 400 million ounces on silver, okay? We only mine 800 million ounces a year. So they're trading 400 million ounces of silver paper, They're trading in two days the amount of global mine production per year. And that's way more than the number of bars that are standing behind those contracts. Same thing with gold, and they do the same thing in London. It is the rehypothecation of this market that has enabled the West to control these prices forever. And for whatever their reason, Gibson's paradox, inverse

relationship between real interest rates and gold or the military industrial complexes need for the Western world to make high-tech weapons, they've kept them cheap.

using rehypothecation. But this is where the story changes because the world has become coordinated, sophisticated, motivated, educated, angry, wealthy, and playing at the same game. So while they've been playing the same game by accumulating on the cheap, they've built the rails and the payment systems and the vaulting systems and the settlement systems to challenge the West. And now they're tokenizing their gold for 24-7 trading and collateralization and lending and they are building the rails and the systems and accumulating quietly everything to challenge the less and They're playing the same game as far as I'm concerned and I would do if I were them Okay, so I want to go for a little bit of a lightning around here, but just to connect some of the dots that you've said here so the the sovereign players are basically saying look I We got a lot of strategic reasons to own this thing. The cheaper the price gets, the better for us right now, because we're bulk buyers. We get a better and better deal the lower the price goes. So we've talked a bit about this in the past, but you would think that the intelligent-minded retail investor who's watching from the sidelines would say, well, OK, well, that's working in their interests. It's working in my interests too.

the regular person should be looking at this and saying, as long as gold's on sale, I should be adding to it. So at a minimum, a dollar cost averaging program has actually made a ton of sense this year. Yeah, if you've been holding on to an existing stack of gold, you've been feeling the pain of the overall price coming down. But if you're making purchases along the way as the price gets lower and lower and lower, Provided indeed the price does go higher down the road. This is where you're locking in your future gains, right? You're nodding as I'm saying this and folks can see that that's what I like about the split screen is I'll often say that and folks think I'm making it up, but you were nodding So a anything you want to add about that and be can you just? Confirm again that that miles Franklin as I'm sure other Dealers do but you guys have a program in place that helps people dollar cost average right where they can set it up and and kind of set it and forget it, right? They can just go about their daily lives. They can just go and earn

their income or do whatever. And every week, two weeks, month or whatever, you know, they're making regular purchases. Totally. We can help them do that. All we need is an ACH or your routing and account number. And we process it through US Bank every month. That's easy to do. And that's exactly what I believe that GlobalSouth has been doing, realizing this and have been standing for delivery.

In a price in elastic manner there they don't care what the prices and the lower the price is gone the more they've stepped up their purchases I just want people to think is it unusual you think that both gold and silver broke fifty and four thousand Precisely on the final trading day of October both critical psychological levels were broken. I don't know seems kind of suspicious to me, but and now they've moved back up So much of this is controlled so much of it is is is paper positioning. And that is gonna change when I believe you start to see real pricing in another currency for same day settlement. That is when it changes. So yes, I do believe it is good. And for those that have purchased metal much higher, remember, you do have the ability if you wish to sell it back to us for a small spread of between two and 3% and then purchase it right back immediately with no paper trail, because you never wrote out a check. We just send you back the material minus 3% or whatever you send us a check for that amount.

That's not a violation of the 30-day wash rule. So if people have bought gold at 5,000 or bought silver at a hundred and want to sell it book the loss to write off penny for penny against capital gains Or future capital gains and carry forward you can do so and get your metal back with privacy because You send us to has to change hands. We receive the metal. We send it back to you minus 3% You never wrote out a check you've done everything legally you can show what you've done with it but I call that constructive reporting. No, I sold all my stuff in 2026. What do you do with the proceeds? Well, if I have to show you here it is, but otherwise it's on your business. So it is something we can do if people want to do it, it is legal. But yeah, I think the price will go higher. Look, there is no other way out of this, but to inflate away the money supply financial repression and holding assets is the only way to survive. Okay. And I'm sorry, walk me through that one more time and let's use the example of silver.

So let's say silver back in July. It's now 50 60% less I can actually do this transaction not trigger the wash rule and still hold on to my silver had a million dollars worth of silver that had a 50% loss You have a half a million dollar loss if it's in a storage facility. It's simple We just move it out into our account and then right back We have to charge an amount Minus the movement and the payment of or the charger brings to move it Enough to to pass the sniff test and has to be done the right way where it's actually moved, right? It's it costs me an additional 3% or so total so it costs you let's say and that's still that's a lot of money, right? Okay, it costs you 3% However, you now just rode off 500,000 against capital gains. Now. Here's the interesting part What'd you do with the proceeds?

It's none of your business, but in essence what you did is minus that 3% We just moved the metal right back. You never wrote a check out for it. So you sold your metal You got you bought it right back privately. It's sitting in your account You never got rid of the possession just for a second goes right back And now you have that paper trail free legally you have the privacy and the write-off that you can legally write off against future capital gains or capital gains you have right now are 3,000 a year off for regular income. Okay. And I'm sorry, how does that not trigger the wash rule? Because the wash rule is specifically for securities. Oh, it is not for commodities. It's because it's not a publicly traded security. Correct. And we have legal opinions from CBIS, a national accounting firm. We've validated it and verified it a million times. We've been doing it for 20 years. And I think the loophole will close largely because of cryptocurrency, because crypto is viewed the same way gold as personal property. And you can do it with crypto too, as long as it's not a security. And therefore, it just allows you to think of cows. You can buy a cow here and you can buy and sell it there. For example, insecurities, there's something called FIFO.

First in first out that doesn't apply to commodities if you could sell anything you want at any time that you you know I'll sell this one not the first one The commodities doesn't apply to those things. Okay, so this is super interesting. So folks if you are sitting on large losses right now capital losses on your precious metals and You are interested with this I would suggest you do two things you talk to Andy and his team there at miles Franklin and really try to understand exactly the ins and outs of this Then

talk to your CPA and just make sure, hey, you cool with this. If the IRS comes knocking, can you explain this?

confidently. But if the answers to all those are, yes, that's fantastic. I just wrote a note down here. We tell people to ask their CPAs. I've never had one come back after they research it. They'll be like, I'll be damned. You're right. I've never heard of that before. And people are only familiar with the 30-day wash rule, which would say if you sell, let's say, Apple at a loss, you don't want to get rid of it, but you want to book the loss to write off against some other capital gains. Well, you can do that, but you have to wait 31 days to buy it or something similar to it back. does not apply for physical commodities. And the most important thing is that possession must change hands, whether it be through storage or shipping it back to us and we back to you completely legal. It's called the precious metals tax swap. Okay, so folks, I'll remind you this at the end here. But if you want to talk to Andy and his firm about this, just go to thoughtfulmoney.com slash gold, fill it with a very short form there.

It's basically a contact me form and they'll reach out to you and they'll answer all your questions around this, but super interesting. I'm really glad we surfaced that Andy. Okay, so let's say everything that you think is going to happen sovereign wise with the precious metals happens. So all of a sudden, all these other countries are using the gold backed new version that China and its partners are setting up here. And then the US, likely in response, says, OK, well, look, we've got to not be left behind. And by the way, folks were revealing we've been buying a lot of gold along the way. So we have a lot more than the 8,000 that everybody thought was on our books. And Tether becomes clear that's been a proxy for the government to accumulate gold and now have a digital way of transacting in it if all this becomes revealed to the world.

What do you think happens to the price of gold? I can't imagine that it would just sort of stay wherever it was the day before. Presumably the world would realize it's totally game on for ounces of gold, correct? Well, who normally positions before the average little guy? Well, that'd be the guys who know where the puck is going, the central banks and the big bull. Both the guys who are actually shaping the policy. Correct. And gold is the

medal of kings, right? Well, if If you make mechanisms like the Genius Act, where money movement is backed by short-term treasuries, 93-day duration or less, and the interest isn't transferable, and it appears like companies like Tether are plowing that into gold, buying more than anyone in the world for the last two years, but the central bank of Poland, you would think that higher gold would actually benefit this country, and it would also benefit China.

It would benefit I'm having dinner with Tom Longo tonight. He's down in town and he would say that This is what Tom would say and I we just interviewed Susan Coena and she would say the same thing I believe in that is that Trump and she are in this together pushing back against the city of London that they are trying to let the price of gold go straight up to issue in a new monetary system To to break free from the control. Who would it benefit rising gold? It would benefit the Chinese would benefit the United States the two largest superpowers on the planet But rising gold would devalue the dollar At some point, instead of by presidential decree revaluing gold, you let gold just synthetically or organically, even though the mechanism is quite synthetic, the Genius Act, let gold go higher and higher and higher and higher and higher. You devalue the dollar. You can reindustrialize. This is financial repression. You can pay down the debt easier. Your assets start to reflect a greater percentage against your liabilities. It would benefit the two superpowers on the planet who are accumulating as fast as they can quietly.

to and lying about it to let gold go higher once this is done. So yes, I think it would ultimately go higher and then you mark it to market because it's still valued at 40,000 to 22,000 on the balance sheet. So you market at 8,000 or 12,000 or whatever the number is and all of a sudden every 4,000 increase in the price of gold gives the Treasury general account 1 trillion free and clear and now you start to see where this could go. So yes, I do think that this is kind of the pushing the price down to accumulate it before the real thing, before it is set free and real price discovery happens. And I think that is ultimately what the system that is being put in place in China will usher in real price discovery, same day settlement, and all of the systems that you see like in UAE and Singapore are now same day in dollars. What happens

first quarter? Will they trade in yuan also? Will they trade in their currencies also same day settlement? I would venture to say probably will. Okay.

So I'm not trying to pin you to a number, but it sounds like if and when this becomes clear to everybody, a 10,000 gold price doesn't seem too out of the ordinary to you, or too out of the realm of possible. Well, not any more out of the ordinary than the 50,000 when I started this industry was 2,100. So no, markets go higher than anyone thinks possible, especially if they're being integrated into the fabric of a new system. OK, let me make a quick analogy. And you just tell me if you think it's a good one or not. So right now, the world superpowers are engaged in a race to win the AI battle. And having enough compute is really key to it. And we're building all these data centers. Writing the most efficient software is really important to it. And that's what China is focusing on, because they don't have Yet at least access to the powerful hardware that we do But all of that lies on top of electrons on actually having the the affordable supply of enough electrons to do all the compute and That seems to be the thing right now that that the West is waking up to to say that might be our limiter here and I've heard some recent alarms being run recently that We may actually have a bunch of like data centers and chips that are ready to go, but they're collecting dust because they're just literally isn't enough power in the grid to power them yet. And China is way ahead of us on this. And folks have seen me share the chart here. China's electrical generation capacity right now is about three times the US. And we're scrambling as fast as we can to try to close that gap. But basically it's a race for electrons. People have just said, OK, this is all going to be one of the base level on electrons.

To me, what you're describing, this new sort of future monetary and trade version of the world, is like that, but it's ounces of gold, right? Gold are essentially the electrons that make it all possible. And so there's going to continue to be a building mad scramble if you're right for physical ounces of gold. Yeah. And the way that the sophisticated traders are able to do it is by masking that's real value by rehypothecated pricing that is only priced in the West. United States, the Comax market sets the price. in conjunction with London. None of these other countries do, so they use it to their advantage. But that's the only reason they're not bitching about it. But this is probably a big reason why China created the Shanghai exchange. And now

the Hong Kong exchange. Exactly. And the thing of it is with the Shanghai exchange, it is now convertible and compatible with Hong Kong. It's called yuan convertibility. What it simply means is that anyone can take digital yuan for, whether it be the petrol yuan bond for oil.

or trading digital yuan across a bridge that allows you to then settle immediately in gold. It makes countries not really reluctant to hold yuan. When they buy gold with it, if they want, you want convertibility. It's exactly right. And I couldn't agree with you more on the AI build out and the electrical implications that is going to have it. And you're beginning to see it in companies like CoreWeave, these AI data center builders that are Their bonds are trading at 80 cents on the dollar and stock has lost 60% and their founders have sold billions of dollars in shares. It's coming. The realization that maybe we didn't prepare well enough will be on both sides of what you just explained and on the data center side. There's a lot of, I don't want to call it a reset, but a restructuring is coming called the fourth turning. I know you'd understand the fourth turning. You've interviewed those guys, Neil Howe, I think. And it's like, yeah, I mean, this is a for turning and every single way it's a new system is coming out of the ashes of the old that doesn't really work for anyone but except those in the West. Okay, so that's a good segue to my next question. And I'm just talking a little faster because I want to cram all these things in before our time's up. So the election last night, we had a blue wave, I mean it was it was a real trouncing of the current Republican establishment and Again folks this question is not a partisan question. It's not being asked from a partisan angle It's just being asked from somebody who is observing hopefully from a 30,000 foot level So Andy a number of the candidates on the Democrat side that were elected in our people that are pushing Socialists or Democratic Socialists policies here, right? And a couple questions on that. You know, presumably those people would be more likely to want to increase government spending going forward, right? And, you know, we've been hearing from all sides, government spending is a big problem here. It's one of the reasons to own precious metals, right, is the more we deficit spend.

The more that debt's going to have to be monetized by the Fed, and more dollars in circulation, purchasing power if your currency goes down. Everybody's doing this in terms of countries. It's not just a U.S.

phenomenon. And while I'm making a point that Democratic socialists will be likely to want to spend even more, it's not like the Republicans have been great here. They've been in charge for the past two years, and they haven't done anything to reduce fiscal spending. But I guess my question here is, is the bounce that we're seeing in precious metals since the election results came out last night, do you attribute that to gold, maybe smelling out increased fiscal spending from now a Congress that's controlled by Democrats, but also maybe even looking forward to 2028 and saying, okay, this blue wave is maybe increasing the odds that a perhaps democratic socialist candidate might be elected for president in 2028, and therefore there'll be even more fiscal spending, and therefore, you know, run to gold to protect yourself from that. Are you looking for a trusted health insurance? Allianz covers you beyond borders. We deliver peace of mind just a click away with global telehealth access and round-the-clock support. Backed by 2 million healthcare providers worldwide, we're trusted as the number one insurance brand for the last seven years.

Visit AllianzCare.com and explore our Singapore plans to find out more. Terms and conditions apply. Yeah and and you know why the hell would you want to hold a treasury when you realize that that is ultimately the only path and you move to to a socialist-based economy what does that do to the productivity of this country to the infrastructure to the tax base? To the sanity I mean I I find it very difficult and and you know by the way, I mean this is what it's all about I mean, I think when everyone says what's different about the United States. That's it It's the it's the lack of common shared values anymore and that is what is different We don't all share the same values about what made this country amazing capitalism is not what destroyed this country It is is fiscal irresponsibility to your point and whether it's it's red or blue They all are stupid in the way that they spend money and it's not capitalism It's the government spending money and look at look at the blue states and the way they've spent money It's not good. They're worse than the red states, but they're both bad, but yeah, I think there's a realization that that we can't become united any longer. We are as divided as we've ever been and that is when when America has done its best it's had its back to the wall but we're all American we're all pulling the same wagon and even if we didn't agree on everything we agreed on what was important and that was you know traditional family values that are out the

window liberty equal justice under the law all of these things that we agreed on You could disagree on everything else, but you agreed on one thing and that was you know common values And yeah, it's very frightening to think what will happen I think the gold definitely has sniffed that out and look the bottom line is simply this that if gold will be allowed to trade freely it would be much much higher But these knee-jerk reactions I'm never really quite sure what they mean because they can go up just as fast as they can go down and vice versa But ultimately, yes, I would think that if that is the case, it is incredibly bullish for the price of gold and horribly bearish for the country. Ultimately is how I feel. And I'm just trying to be the party of common sense. That's all. All right. And again, folks, as you can probably tell here, I'm really trying to walk the tightrope of not trying to be partisan here as well.

So let me just connect another dot, though. So you mentioned the 4th turning. So one of the things that Neil Howe, one of the co-developers of the 4th turning framework said that it's a feature, it's emblematic of a 4th turning, is that the populace increasingly turns to the government to solve the problems. And like wealth redistribution and increased social spending, Again, these are features of a fourth turning. They're what to expect. And perhaps what we saw last night, I haven't talked to Neil yet, but he might say, yeah, not surprised at all. You have people who want more government, more government involvement, more government spending coming in, again, to solve some of these real issues like affordability. And that's what happened in the previous fourth turning.

And I'm not going to put a good or bad on it. And I think in many ways, there are a lot of people who are hurting. So they say, yeah, well, we're hurting. We want the government not to just reward the billionaires and the big companies and all that stuff. We want some of that to go to the little people too. So my point is just this may just be part of the overall forth-turning script, like it or not. Don't worry. Don't spend your time national your teeth. Just spend your time to your point Andy looking where the puck is going and asking Okay, what are the implications of that and if that means in acceleration and the Decrease in the purchasing power of the dollar Okay, great, then I want to be in assets like gold that will preserve their Their purchasing power versus it. Let me connect this to another

political question, which is Okay, so and I'm asking you to totally speculate here So President Trump, obviously, not happy about these results. He is already basically saying, look, I'm going to veto anything that comes out of Congress that I don't like. Congress is probably going to say, especially since they have more seats in the Senate than they thought and they have now the Senate and the House, they're probably going to drum up impeachment or other things to try to thwart Trump. But in a lot of ways, We may see Trump unleashed in the next two years. He just says, look, I don't care. As long as I'm still sitting in this presidential seat, I'm going to do everything I can by executive order. And I'm just going to do everything that I think should be done, whether it's popular or not. I don't care. I'm going to be out of here in two years. I'm still going to be a billionaire. I'm going to hold court at Mar-a-Lago. I don't really care what anybody thinks about me. The gloves are off. So maybe he attacks Iran. Who knows more? Who knows what's going to happen there?

But maybe to your point, Andy, if there are plans to revalue the dollar versus gold or there are plans to, you know, take tether and make it an official government instrument or whatever, does that maybe get accelerated here? You would have said, look, I was going to try to be more nuanced, but screw it. I only got two years left. Nobody likes me. I'm just going to do it anyways. I think you would have to. I mean, I think you have to what you really have to do is you have to take take the blinders off and show everyone everything and be more open about what he's actually trying to do. But yeah, I would think that is exactly what I would expect to happen. You know, I look at a place like Texas and I wonder what's going to happen. I have to research this. I don't know if it'll affect it, but you know, their legal tender aspect of gold and silver, could that be changed by the new you know, they got a blue attorney general and a blue governor and I mean, could that change? I don't know. Is that at the top of the list of things they want to roll back? I don't know. I don't know. I have to look into it. But I'm just simply saying that, yeah, I think he would want to do that as fast as possible. But, you know, yeah, I do. I think there's going to be a very interesting two years. And if I were him, I would, I mean, All of the things that he's wanted to do but hasn't done for whatever political reasons, I think now it's time just to take the gloves off and do it. And if that means, you know, lots of indictments, be open about it. If that means finally showing

the Epstein files, be open about it. It's like, if you want to do these things that you ran on, then do it.

And and maybe you see the left that is so hell bent on on retribution and on impeachment that they they step on their own foot. I don't know. But any way you look at it, it's not a good thing. But, you know, it's it's it's not unusual either. I don't think that any political party has owned the same retained it for a second, you know, through the midterms in like 60 years. So this happens all the time. Right. But but never quite this divisive for sure. So I would if I were him. If I believed in it, yeah, I would say fine. It's time to take the gloves off and the blinders off and let people see what I see and let's do it. Let's do it. And I think he has no choice but to do it. OK, I'm going to start laying in the plane here. But before I do, is there anything else that's burning brightly on your radar that I haven't asked you about yet?

We haven't talked about silver at all, really. We can talk about anything you want. You know, I think one of the things that I'm certainly concerned about as well is the hack with finance. I think that, you know, the AI is becoming something that is very, very, very concerning. The hack of poly market, hack at the Philadelphia 76ers. Giant scoreboard that said you never said the magic word. You never said that they tried to reset it same thing the hack of the freezers throughout Europe I mean the AI hacking and and what does that mean and can I add one thing to this too? Yeah, folks have been hearing me talk over the past week about How I've fallen down the agentic AI hole. Yeah, you told me that yeah It's been just totally life-changing in terms of the things that I'm having AI do for me now in terms of Again, not bringing me answers like a souped up search engine, but actually, okay, these are tasks I need done AI, please go out and do them for me. And both in work and in personal life, it literally, I think to say life changing is an accurate term. And I am still, as I do it, more light bulbs continue to go off of like, wow, I could actually have it maybe do this too. So it's becoming super powerful. And I can totally see now, the average person. The technology is simple enough that anybody, no tech background can just talk to it and have it do all the things they want it to do. I can totally see the future now where there's just going to be literally billions, trillions of agents going out there and just doing stuff for us all the time. And I'm already seeing headlines that banks are having a lot of trouble with this because people's agents are

logging into their bank accounts and the banks are having a hard time telling Okay, which of these are sanctioned agents and which of these could be rogue, you know Bad actors in the mix, right? So in the more that I'm kind of giving AI access to other Websites and stuff that I work with because it's got to go out to them and do something for me You know, there is a voice in the back of my mind saying man if this agent went rogue It could just nuke everything for me. It could nuke all my YouTube videos. It could nuke all my social media posts. It could nuke all these other things that I've got it connected to. And so Rogue, I could maybe just empty my bank account. So these are just really real concerns. And I'll let you continue. But been in a world where, yeah, Binance just got hacked. And they didn't hack Bitcoins. They didn't hoard the Bitcoin code or the Ethereum code.

but they hacked the digital vault that these things were stored in and were able to steal the coins. Again, I get the promise of crypto and in many ways it's very elegantly designed for people with our concerns about fiat currency. But things like all the things you're listing, I think do make people on the margin less comfortable and confident in owning those things, which again raises the question, well then what do you own? and going back to something that's tangible and physical has a lot of appeal. What you just said is what happened to Poly Market, which is a massive high-tech company too. They found that there was malicious code designed to access logged-in trading sessions through a third-party outside service used by Poly Market's website. And this code was designed to sell users positions, like you said, and transfer their assets away.

just like that now they said it was only three four five million dollars will give it back but you know this was six billion with finance in a matter of 60 seconds i find it to be very scary when you put into the mix every single country in the european union has sent out letters to people saying you need to prepare you need to have food and water and you know up to several days worth you got the the deal here with the defense department every military base has said 90 days of prep including I didn't know this was a thing portable nuclear power generators 90 days, but we're only told to for a few days damn Bongino I was watching an interview with him He said you know I I wasn't in the military But it was in the secret service and in the

military you can't panic and the secret service if you panic you're never coming on assignment again You're done right is that don't panic, but you know what? Having been prepared for 30 days worth of food and water and this and that will help you from not panicking. There's this huge Like we told you so kind of playing about being prepared right now, which makes me kind of concerned. And if I had to guess, you will see some sort of a big hack into a system. Now, here's where the conspiratorial side of me starts to think, well, you wanted to push everyone into the bond market to bring down yields. Well, it wouldn't take much, but to scare the heck out of people through some sort of a major hacking into some major... Let me just...

Human for one second. I've read this to you before but I want people to come on turn it give me one second This is when they asked Adam Glipinski the head of the Polish Central Bank who's bought more gold than anyone in the world for the last two years why you guys buying gold he says and i quote in these difficult times of global turmoil and the search for a new financial order whatever that means a new financial order gold is the only safe investment for state reserves and gold will retain its value here comes even when someone cuts off the power to the global financial system destroying traditional assets based on electronic accounting records now we don't think this is going to happen but as i'm saying goes for warned us for our central banks are required to be prepared no matter what so could it happen sure You see one big hack, and they keep telling us, be prepared, be prepared, you're seeing hacking everywhere. How fast would you see people fly into the bond market? I think, you know, I have a heart, I hate that my mind goes that way, but that to me is the one thing we should think about. We've become incredibly digital, and AI is growing faster than the IT sophistication. JP Morgan, two years ago, was paying one billion a year for IT security, one billion.

What does that do for every other company or bank or brokerage or anything that isn't that wealthy and sophisticated? It's going to be a nightmare, I think, before it's all said and done. All right. Well, folks, we're kind of talking here now about sort of the Armageddon insurance role that Goldcombe played. And I don't want to be doom and gloom, but realism and pessimism is right there. Realism and pessimism. Yeah. I think the key

takeaway here is we just spent beyond the past couple of minutes, the hour before talking about all the reasons why monetarily, given what's happening in the monetary system and trade, that gold should have good tailwinds ahead of it. It also does have this sort of, hey, in really bad times, everybody turns to it. And so it's got that optionality. Let's hope we never need to use it. But to Andy's point, I think having at least a little bit of physical somewhere where you can get to it in a crisis, Power grid down, you know, whatever One makes sense and be it'll just help you sleep well at night. I don't need to have a ton You can keep the rest stored, you know in a bolt like with the bolting services that Andy and his team use And again, we're not trying to not trying to scare anybody, but it does have this additional, you know bad times Optionality value in it as well. All right. Well Andy look thank you for Coming on to doing this, again, thank you for soldiering through the tech issues. So a couple of things. One, you have been offering special offers to this audience ever since we started this partnership. Again, thank you. I've only heard very great things about that from the people that have taken you up on it as well as the phenomenal customer service of your team. What are you able to offer folks these days? Are you looking for a trusted health insurance?

Allianz covers you beyond borders. We deliver peace of mind just a click away with global telehealth access and round-the-clock support. Backed by 2 million healthcare providers worldwide, we're trusted as the number one insurance brand for the last seven years. Visit AllianzCare.com and explore our Singapore plans to find out more. Terms and conditions apply. So, I mean, I'd like to offer other things. But I have a hard time moving past the pre 65 silver. What did I did I tell you? I know I said something below spot. What did I tell you below spot? Yeah, here. Let me let me pull it up here because I'm sorry because I know I did this special for you It's higher than what we're selling it for but below spot on pre 65 silver is is In my career, you don't see that you just don't and it's an anomaly and I think you take advantage of price anomalies Okay. So what you texted me and we'll confirm whether this is indeed what you're able to do. Yeah, whatever I texted you, I've already taken care of. Okay. So it was 25 cents under spot for the pre-1965 dimes and quarters. And I have almost 100,000 face value in stock. So that's a lot. That's 100 times...

715 so ounces So I have a lot in stock Anyways bottom line is there's no better value you're getting it below its melt value and during the pandemic for four straight years I would have paid you nine to ten dollars over spot to buy back as much of it as you would send to me that was an anomaly this is an anomaly and It doesn't take but just a little bit of some form of an awakening by the mainstream to realize that my gosh I need to get something and just like that the availability dries up quickly, so there isn't a better value. I will always, your people will always get our best pricing and that's why it's important to call and talk to someone and let them know they came from you or through that form so that they are given the very best service, very best pricing and attention to detail. Okay, and folks, I just realized I gave the wrong URL earlier, just fixed it here. It's thoughtfulmoney.com slash buygold.

whether you want to take Andy up on this pre-1965 times and quarters offer, whether you want to talk about gold, whether you want to talk about anything else in precious metals related questions you have, just go to that URL right there. I'll put it in the live chat as well. It'll be in the description below this video if you're watching the replay. just felt the very short form, and Andy and his team will be in touch with you right away. And they will, like I said, they'll give you a white glove service and handle any and all questions that you have there. All right, Andy. Let's see. Additionally here in just wrapping up, one of the reasons why you have been able to offer such an attractive discount on the junk silver. And again, folks, junk silver is pre-1965 US coins.

is that the refiners got really backed up. So A, where is that? Is that normalizing? And B, where are premiums right now? They were pretty high in the space. I'm assuming they've come down as the prices drift down. I'm glad you asked that question, because this is how the big money has been able to quietly reposition also. What happened in January and this entire tenuous year has been so counterintuitive, the price action to what's happening, that you had a lot of people just bail. The reason I bought everything for the last year that I could find in pre-65 Silver, because I can hedge the metal content, if I can hedge it and I'm getting it below melt value, what is my risk? Zero.

I don't have risk in holding it. It's just the cost of capital. But I bought as much as I could because I knew that anomalies always work themselves out, as this one will, too. Premiums on the American coins like the Eagles are starting to climb higher again all of a sudden, just like that. Interesting. And they always lead the way. They've gone up considerably, what I consider considerably, in a week. And so at the same time, The premiums across the board in my mind are far too soft to where they should be and it's just been because there has the retail market has been More or less either you get it and you've been doubling down what you've been buying or you don't and you're not buying any at all and so although Business in terms of what it used to be prior to 2020 would be considered fantastic It's nowhere near what it was the last four years in terms of the average person That will change people are very fickle and they they focus too much on the minute by minute by minute instead of seeing the big picture Those people will see the big picture and when they do it changes just like that so look I've done this for 37 years February and I've Seen premiums or or retail prices on junk silver dimes of course below spot. Maybe 1% of the time. It's an anomaly it's a hell of a value. So I bought everything I could knowing I could hedge it. You will see premiums climb at right now. They're still pretty cheap except they're beginning to move on American made products. Okay. So you're starting to perhaps see the trend in premiums start to reverse. And again, the earlier discussion about dollar cost averaging, those who have been dollar cost averaging this year, have been doing pretty well then, correct? Because they've been getting lower and lower prices as entry points, but they've also been getting not just a lower spot price, but a lower premium as well, right? Yeah, and those people are rare because what I've learned in all this time is that everyone wants a lower price until they get one and then they don't buy. Which is the craziest thing ever, right? If you think it's on sale, buy it low. Don't ask Rick to rule how he became successful. I've had lots of talks over a cocktail with Rick on this one. Ask him how he became successful and he will tell you the biggest deals he ever did. He bought because he knew it in his heart, mathematically, logically, economically, geologically that it was going to go.

And the biggest one he ever did, I don't remember the name of it, he went all in and the price fell by 50%. And then instead of selling it, he doubled down and he became a gazillionaire. Now that's kind of hyperbole, but my

point is it's true and he'll tell you that and that is how you become successful in investing. You buy when everyone else is running. You don't buy when everyone else isn't. But who's been doing this before everyone else runs? The most knowledgeable traders in the world who have the information before they have all this money, they also got the information to central banks. And whoever's doing it here on Comex, that's all I focus on. And the price, yeah, bums me out. It's annoying. I hold hands. I talk to people all day and console them and see the big picture. It gets tiring. It's annoying. And I'm out here, you know, the first comment on your thing. Andy's been wrong. I have been price until I'm not. I haven't been on a big picture, but if you look at last few months, sure, price has gone down. Fundamentals, what has changed other than the price? Nothing.

fundamentals are getting worse. So, yeah, I think, I just think that let's just see how this all finishes out, I guess is what I'm trying to say, because the biggest money in the world is telling you where it's going. Trust your gut. All right. All right. Well, Andy, again, can't thank you enough. Everybody else, if you have not already talked to Andy and his team and would like to, again, just go to Thalphamoney.com slash buy gold. And Andy, we'll do this again in a couple weeks. Thanks so much. Adam, I look forward to it, man. You're the class of the industry. And thank you for having me. Thank you, everyone. I look forward to picking up where we left off. Hope to talk to you all again soon. All right, brother. Thanks so much, everybody else. Thanks so much for watching. Are you looking for a trusted health insurance? Allianz covers you beyond borders.
