“I’m Insanely Bullish on Bonds” | Jared Dillian on Copper, Bonds, Semis, and The Awesome Portfolio

Podcast: Monetary matters

AI Executive Summary

1. Core Thesis: The episode argues against the prevailing market narrative that high bond yields and fiscal deficits are driving a bear market, suggesting instead that demand for bonds is currently suppressed due to supply constraints, private sector debt crowding out, and extreme sentiment rather than fundamental economic realities. While acknowledging that certain sectors like semiconductors and AI stocks show signs of exhaustion, the hosts emphasize the critical need for investor psychology management through diversified multi-asset allocation (stocks, bonds, gold, cash, real estate) to mitigate volatile drawdowns, rather than relying on pure long-term index investing which exposes investors to 40%+ worst-case losses.

2. Key Arguments & Data:

3. **Bond Market Bear Market:** Current 10-year yields (~5%) and long-term yields (up to ~6-7%) are driven by supply constraints and private sector debt issuance ("crowding out") rather than inflation or uncontrollable deficits (US deficit is only ~6% of GDP).
4. **Inflation & Data:** Inflation has cooled after five years despite a 50-basis-point rate hike target; payrolls are weak (55k jobs forecast), but the unemployment rate is trending down to 4.1% due to participation rate issues (immigration vs. native-born).
5. **S&P & AI Valuation:** High-yield semiconductors and AI stocks (Nvidia, AMD) may be top-heavy; retail positioning has cooled recently while hedge funds held leverage long positions which recently unwound (Citadel liquidation on Aug 27th). NVIDIA's revenue growth is slowing from double-digits to ~50-60%, signaling a derivative peak.
6. **Gold & Metals:** Gold rallied 15% in a month after Jackson Hole but dropped back through the 200-day moving average at $4,500; key support levels identified are $3,900-$4,000. Copper sentiment is hot due to AI trade speculation, but Jared notes gold/silver/platinum as better long-term alternatives.
7. **Private Credit Liquidity:** Private credit and private equity markets face an unwinding that will take much longer than public markets due

to a lack of liquidity; this bearish view remains unchanged despite recent media coverage.

8. **The Awesome Portfolio Strategy:** Diversifying across stocks, bonds, gold, cash, and real estate (roughly 1:4:1:2:3 ratios) cuts volatility in half compared to S&P 500. Worst-case drawdown drops from ~40% to ~12%, protecting against psychological panic selling despite potentially lower compounding returns.

9. **Productivity & AI:** AI is financing tech with record debt loads (e.g., Google) unlike the equity-fueled Dot-com bubble; high CapEx demand may be inflationary rather than deflationary.

10. Actionable Takeaways:

11. **Reallocate to Bonds:** Increase exposure to bonds as current yields offer a "deals" opportunity for long-term holdings (3-5 years) and act as a hedge against stock volatility.
12. **Adopt Volatility-Conscious Allocation:** Shift from an 80/20 S&P 500 strategy to an equal-weighted multi-asset portfolio to reduce emotional stress and prevent "tapping out" during corrections.
13. **Monitor Labor Metrics:** Watch payroll data closely (negative 50k jobs vs. positive 100k) as a trigger for the Fed to pivot to dovish policy, which could boost gold prices near $4,000 support.
14. **Avoid Retail Momentum in AI:** Steer clear of concentrated bets on over-valued sectors like semiconductors where retail positioning is low but institutional leverage may unwind; prioritize companies with tangible revenue growth data over hype-driven narratives.
15. **Manage Sentiment Bias:** Counter the "bond market bearish" media narrative with a contrarian approach, while maintaining discipline to hold investments through expected market volatility rather than selling during drawdowns.

Full Transcript

joined today once again by Jared Dillion of The Daily Dirtnap and the new book, The Awesome Portfolio. Jared, good to see you. Good to be here, man. Thanks for having me. Yeah, you too. Jared, looking at the front page of Bloomberg, global bond sell-off sends yields to highest level since 2008. What do you make of the bear market in bonds that we've had, the fact that these long-term government bond yields can't really seem to catch a bid? Your thoughts? How much time do we have? As much time as you got. This is a very long story. So I am of the belief that there is a mind virus going through people in the market. People believe that deficits are out of control. People believe that inflation is out of control. We are really back to where we were in the late 70s when people were calling bonds certificates of confiscation. The reality is, is that inflation is not that high. It's come down quite a bit in the last couple of months. It continues to come down. Yes, it's been above the target for five years. Yes, wars did say it's a firm target.

I don't understand the obsession currently when the rest of the economic data is actually terrible, right? So we've had two-week payroll reports. The estimate for the next one is 55,000 jobs, and we have a 66% chance of a rate hike to madness. All the other data has been, like I said, inflation is coming down. Before I walked in here, we got, well, we had Chicago PMI, the day of the Jackson Hole, which was 10 points lower than expected. Joltz was terrible today. ISM was slightly below expectations, but the point is, is that not only is inflation not a concern, it looks like we are entering a slowdown in growth, right? Getting back to the deficit's point, everybody is worried about supply of bonds.

In absolute terms, the deficit is 2 trillion, which is a scary number, but it's only 6% of GDP. And back in 2010, it was 12% of GDP. And people showed up at the auctions. The auctions had bid to covers of three or higher. So it's very easy to measure the supply of bonds, but nobody ever talks about the demand for bonds. So if we had a big risk off event triggered by some unknown catalyst, but if stocks were down 20%, trust me, interest rates would be much lower, right? People would show up and buy bonds. So I am, I am not worried about the bond market at all. I'm insanely bullish.

I think 5. whatever on, you know, 5253 on 30 years is an incredible deal. I think 47 on 10 is an incredible deal.

I personally have moved a huge portion of my money into bonds in the last month And this is this is a very long-term trade for me. I'll hold this for three to five years But I am a I am a big believer in this and you think so you're bullish on bond you think that the narrative of That bond yields are going to go to those the moon is he's gotten totally out of hand. Oh my god Yeah, I mean, so somebody just sent me, I guess Ray Dalio wrote a piece in Time Magazine about bonds. Like you said, it's on the Bloomberg front page every single day, like every single day, people are obsessed with it. And you know, I'm a sentiment guy. So when I see stuff like that, like, you know, I'm just naturally going the other way. Yes. And the point you make about supply is interesting because there's a Video I've seen of Paul Volcker, you know rest in peace legendary Fed share probably 1978 1979 somewhere around there, you know, maybe early early 80s but the long-term yields were like 12% and he was asked why are you yield so high and he said well the government is having to compete out in the market and there's just not enough You know, there's just so much bonds that are being issued the private sector the government and obviously what we have now is 10 to 50 times higher in terms of issuance. So I think that demand is going to catch up It definitely is it is interesting. You said 2010 I think that you're totally right that everyone wanted bonds in 2010 I think you know the unemployment rate then was a lot higher We came out of a financial crisis when everyone lost money from taking too much credit risk and bonds rallied then there was all this regulation passed to make credit risk unattractive to take and it incentivize taking duration risk interest rate risk bond risk yeah now you know we come out everyone in fixed income lost so much money from buying buying duration so i think it is a slightly different scenario but i'm inclined to agree with you Yeah, one point I do want to bring up is that a lot of this AI issuance is weighing on the bond market. So, you know, when Google comes to market with a 40 billion bond issue, that puts a lot of pressure on the market. So you were talking about Volcker basically talking about the crowding out effect. Yes, you know, the government borrows first and the private sector borrow second. But You know if they're if if you're getting a trillion in bond issue inside of the private sector that obviously puts a lot of pressure on yields too Yeah,

and also just a sentiment thing. There's a very popular AI podcast and they were they were talking about how basically AI is going to rule the world. There's gonna be so much You know ish demand for capital that yields are going to go To double digits or maybe even triple digits. So I think as a sentiment indicator That's pretty yeah, these people are very smart about AI, but you know, obviously less well versed in finance. So so I think that that's um That's a pretty strong sentiment indicator. Yeah. Yeah, I mean look like It's uh, it's been pretty lonely. I mean, I'm sure you saw the torsion slot comments from over the weekend And you know, just break it down real basic, you know, he was talking about AI And he said, look, there's two possibilities here. AI succeeds and it's massively deflationary and yields come down or AI fails and the market crashes and yields come down. He's like, there's really, he's like, I don't see a scenario where yields don't come down here. I have a lot of respect for Torson's lock. Like he's one of the more thoughtful economists out there.

He absolutely is and he that you know for a long time he stuck his neck out saying that rates would be higher than normal Which he obviously was was correct about yeah, I I love torsion I will say that I think that argument is probably true on a ten-year time horizon But Jerry like so many people in tech they always say that tech is so deflationary It's like I don't know. Have you paid your Netflix bill? It's not that deflationary like it's it's and also just I think that the demand for catbex is Demand for capital from CapEx is going to be so much more of an inflationary force than the deflationary force of increasing productivity. I also think productivity is kind of fake. You think it's fake? I think that productivity is a real concept, but I think that it's just such a hard thing to measure. One thing I'll say is that productivity skyrocketed in March and April 2020 because so many people got laid off.

Capital and labor are in the denominator and that goes down it causes productivity to you know be kind of artificially think so I'm yeah, I'm a fader of productivity like in the practical world, I would say okay Cool. Yeah, what do you think about stocks Jared? You know, it's funny I have I have an assistant. He's also my execution trader and I had him pull up the top 50 stocks charts In the S&P this morning and it's really interesting exercise like I used to do this when I was at Lehman I haven't done it in

years but when I was at Lehman I would literally get a glass of scotch and Sit down and go through all 500 charts in the S&P and if you do that it starts to paint a pretty clear picture as to like What is topping? What is bottoming right? so it looks to me like Semi's health care and financials are topping right now You know, you know on the macro dirt podcast that I do with Tony Greer I talked about financials topping a couple weeks ago I talked about how JP Morgan was a pretty good short Goldman Sachs Morgan Stanley Wells Fargo all look like they're topping Health care Johnson and Johnson and also NVIDIA and AMD a couple of the other semi-names. I'm seeing some charts that are bottoming, interestingly enough. Intel looks like it's bottoming. Oracle looks like it's bottoming, but I'm seeing a lot more charts that are rolling over than charts that are basing. Okay. Healthcare had been a laggard, but has been recently catching a bit. Semis have been on fire for three years. Tell me your view on Semiconductors powering the AI trade and in particular Sentiment on semiconductors do you think everyone is still balls-long? Semiconductors and so convinced that you know Nvidia could never go down 30% Yeah, I mean I think you have to distinguish between people like you and me like smart people and people who work at hedge funds versus You know your average retail people like I teach college students, right?

And I have a student who he showed me his portfolio. It's 50% Nvidia and 50% Broadcom. And that was his entire portfolio. And my suspicion is that's the case with a lot of retail investors in the US. Like, they're, you know, they were the darling stocks for a long time. Everybody piled into them. Yeah, I hesitate to use the word dumb money because they've been right, you know, for sure. Um, but they're probably not going to sell at the highs. Okay. Um, so, you know, I don't look, I don't really think of things in terms of fundamentals. Like, you know, the last NVIDIA earnings, the leather jacket guy said they were growing at 70% and the stock ripped. Um, I mean, for sure, like NVIDIA is growing at 70%. Um, What I've been waiting for for the last six months is for that second derivative of growth to change And you see the growth rate start to come down to 60 or 50% and that's when the stock that's that's when the stocks are gonna top so yeah In video, I think earnings are accelerating I think they you know earnings revenues were going like 200% a few years ago and they slowed down to like 50 or 60 So I think he's guiding for Yeah, yeah revenues were growing

like 55 so they did slow down and now um I Yeah, he guided the cfo guided for 70 growth over the next 12 months Jared I actually have some data from a company called vanda research You know, I'm lucky enough to be on their distribution, which is like top of the line Positioning data on retail and they actually say that retail positioning in semiconductors is Among the lowest it's been over the past two years and that actually the selling in Overall single stocks for retail community in late January in sorry late July. So basically the you know the hedge fund Unwind was the biggest since 2020 so I I think Jared Who is extremely long semiconductors is hedge funds and semiconductor and institutions? I think institutions are like very very long semiconductors, but interestingly I just want to offer that as like a Potential data point about how retail was maybe a little calm down a little bit. I like it. I like it I can go with that I mean if he think if he think about, you know, look, I would never want to work at a pod shop Because you know, I sustained drawdowns larger than 5% like it's very difficult. It's it's very difficult to manage money in that environment, right? but You know my guess is all the multi-strategy hedge funds like all those pods were long semis and related stuff for a long time I mean it like you have to be right like I mean, that's that's just the way that business works So, you know, then you had to shake out a couple of months ago. I guess it was last month But I think that the the bottom was like July 27th. Yeah. Yeah, do you think that that was the bottom in semiconductors. We had a strong bounce coming out of that. It's faltered a little bit. Well, I think anytime you have a leverage player that goes to you, that that is that usually marks a bottom, right? Yeah. And so Citadel got the cleanup print on that. And now they're pretty much out of that trade at this point.

But yeah, just for audience. So yeah, so situ where situational awareness hedge fund was very long semiconductors and they liquidated Most or all of their publicly traded securities sold them in block trades to Citadel that was announced July 27th or 28th and then in the middle of August like later later August Citadel announced that they had sold the bulk of those positions. So yeah, I agree with you hedge fund sea leverages are actually bullish because they they The owners go from weaker hands to less weak hands. Well, the thing is, is that if you go back to the financial crisis, there were a number of blow ups. But you know, when Bear Stearns blew up, it was March 17th of 2008. And there were a lot of people who said, that's it.

That was the bottom. And the S&P rallied 17% over the next three months. Wow.

So, you know, everybody thought the coast was clear. And then, of course, the main event happened, which was Lehman. So, you know, I kind of struggle. I mean, look, situational awareness was a gigantic fund. It was humongous. But I struggle like it's the same thing. Like the most leveraged player gets taken out first. But there's still so much leverage in the system, you know. So, like my guess is there's another situational awareness coming in the months down the line. You know, there's too much leverage in the system. Very interesting, Jerry. Could you share more of your thoughts on sentiment with regards to semiconductors or AI broadly? Well, you know, we had four magazine covers on AI in the last week. One from Barron's.

which said something like it will never end or something like. So I read it in your newsletter, the Daily Jerk. I think it was something like the AI bubble will never end. So they're doing that classic journalist thing that I've done sometimes of like playing both sides, being like the AI bubble, you're calling it a bubble, but you're still bullish, you know, it's like make a call, you know? So, yeah, but yeah, no, the four magazine titles are, it's a little brutal on the sentiment side. Yeah. Yeah, for sure. So look, I mean, there's nothing in the S&P chart that leads me to believe we're going to crash tomorrow next week next month. The chart is pretty neutral. Like, you know, I'm not seeing any like, like huge red flags in the technicals. The market's actually pretty quiet, all things considering. I mean, we, you know, it's not Labor Day yet, like I'm sure things will perk up after Labor Day. But yeah, that's basically where I stand.

So yeah, also the S&P's hold on held in so much better than I would have thought with the massive sell off and semiconductors like I I would have thought oh my god if Semiconductors go down 30% like the S&P will be down 18% and it's that was not true at all. And so I guess yeah, what do you make of what has been rallying to fill the gap? Well, I mean, you're looking at banks, you're looking at healthcare, you're also looking at energy and industrials, although industrials have been coming down in the last couple of weeks. But yeah, like like I said, you know, when I went through that chart package, like this is this is all the stuff that looks like it's topping to

me, you know, especially the broker dealers like Goldman Sachs and Morgan Stanley have very scary charts. Tell me about copper out of all the metals I am least bullish on copper.

like I'd much rather own gold, silver, platinum, palladium than copper. I think sentiment on copper is pretty hot because the AI trade. So the chart, I mean, the charts in the upper right hand corner, that doesn't necessarily mean you sell it. But it doesn't really look like it's topping. But the last couple days have been kind of ugly. So I'm not sure what about gold. So I think people are freaking out about gold after Jackson Hole. So basically, we rallied 15% in a month with gold, which is a huge move, and it was well needed. After Warsh's speech, gold broke back down through the 200 day at 4,500. So now all the amateur technicians are like, oh, it's back through the 200 day. So it's going to go back down to 4,000.

We might retest 4,000. I kind of doubt it I think once you cross through the 200 day a number of times it kind of loses its significance, you know So I'm cautiously bullish here You know, there really isn't support until 3,900 or 4,000 but that doesn't mean it's gonna get there, you know And ultimately if you look long term I mean, basically, we have payrolls this Friday, right? And the job's data keeps getting worse and worse and worse. It's 55,000 expected. If we get a super ugly jobs print, like negative 50,000, negative 100,000, something like that, this whole trade is going to reverse. And Warsh is going to be the best gold salesman of all time. Because he's going to be dovish. Yeah. Yeah. So, Jared, obviously, as you know, The non-farm payrolls is quite correlated with immigration So if you have huge levels of immigration immigration legal and otherwise like that causes non-farm payrolls to be good So like under a Biden administration when we had like 300,000 non-farm payrolls a month in some months that wasn't necessarily like amazing because Amazingly a sign of a strong economy and likewise during Trump when migration is neutral or even negative the Maybe the break-even rate is like 40,000 or 50,000. So really the unemployment rate has been going down. So yes, payrolls have done exactly what you said. They look abysmal. But the unemployment rate has actually gone down. Well, that's because of the participation rate, right? Yeah. Yeah. Yes. And I think that's because, in part, native-born Americans have a slightly lower participation rate than immigrants, I would imagine.

So yeah, I mean the unemployment rate is like, you know has 4.1% and not only on an absolute level is it good but it has momentum like it was at 4.5% unemployment has been going down. So I'm curious, you know, just how weak is the labor market? Yeah, the unemployment rate is a little bit of a head scratcher. Like if you remember when it got up to 4.5, everybody was saying that it triggered the SOM rule, right? Like and Claudia SOM came out and said actually technically it triggered the SOM rule, but it probably did not. And sure enough, the unemployment rate has come down to 4.1. So tell us about baldness drugs. I don't know anything about it. Literally, I just saw a tweet and I put it in the newsletter. I will say I do have a history of finding. You do know an artist Eli Lilly. So so years ago.

This was like in 2015 or 16, I think it was 2016. I did a lot of research on immunotherapy, which is basically a cancer cure. It's a drug that attacks cancer cells, which your immune system does not. And bought something called Kite Pharmaceuticals, which was an immunotherapy biotech. And basically it was a three-bagger. It got taken out, I think, by Bristol Myers. And then a few years ago, I was early on the DLP ones trade. I made a bunch of money for subscribers. So shout out. Yeah. Yeah. So, you know, this, like, I kind of have a philosophy about this, like, invest, then investigate, right? The first time you hear about something, you should buy the stock.

and then you do your research. Because inevitably what happens is people say, oh, it's a baldness drug. All right, I'm going to research that. I'll get to that later. And then they never do. And then the stock's up 200% and they miss the whole trade. So I gave it to my subscribers. I'm like, look, you know, I'm just putting it out there, research this. And, you know, maybe it turns into something. Yeah, that that is good. You know, I Actually have been looking into some of these stocks myself. So I think probably There's one abschie corp that is it says it's AI powered drug discovery. So I get a little skeptical there. I think the other one is the ticker is M A any like you have a long flowing mains such as you Jerry and really what it is is just extremely high powered Rogaine minoxidil which which I'll be honest like I'm I'm on Minoxidil and normally the reason that they don't crank up the dosage a ton on monoxidil is because it can cause like heart palpitations and heart issues. So they're saying we're able to crank up the dosage and give

people a ridiculous amount of monoxidil in a way that isn't going to give them heart issues, not heart issues, but heart palpitations. And it's like, it's not like it's some drug. Do we know if it works or do we not know? We know it works. It's extremely powerful at like growing hair. It's just being able to do that extra, extra power. There's another company begins with a C.

And it's a European company that also has an angle there, but I yeah, I've been looking at myself So when I saw you were writing about it Just wanted to say that Jared. Do you do you think that AI is a is a bubble? I do I do. I'm not I'm not bashful to say that I do it's Let me just back up for a second You know, we were talking about the debt issuance from Google and the hyperscalers and stuff like that like You know, in my lifetime, this is the first time I've seen tech being financed with debt. Like usually you finance tech with equity, right? Because the asset has a very short lifespan. It's going to be obsolete in a couple of years. You don't want to take out 10 or 30 years worth of debt to finance an asset that's going to be around for two or three years.

So, you know, the dot com bubble was all equity, like nobody was issuing debt. And this time we have a lot of debt. And the debt, the leverage is what's got people in the trouble. Also, this is dead at high interest rates, you know. So I don't know what the spread of Google paper is over treasuries. It's probably like 60 or 80 basis points or something like that. You know, but they're essentially paying a 6% coupon on this debt. It's a lot. It's certainly higher than the 2% or 2.5% that they pay in 2021. Jared, I do think, though, you hear this argument that with bond yields rising, are the hyperscalers going to stop issuing debt? It's like, no way. They don't care at all about it. Obviously, the finance people working at these companies are aware of this issue. But are the CEOs going to say, oh, my god, the 30-year treasury yield just hit 6%. Stop Cap X. Stop Cap X. It's not going to happen.

This is not going to happen. Jerry, tell us about your new book. Yeah, so I have it right here. It's the awesome portfolio. And I'll tell you a secret about this book in a second. But first of all, the way we save and invest for retirement is very, very dumb. And when I say we, I mean your average person, right? Basically, ideas catch on when they are simple. And people have been taught a very simple thing over the last 20 or 30 years. Very

simple. You say, put all your money in the S&P 500 in the index fund, dollar cost average it, ride out the volatility and never sell. That's very easy for people to understand. And that has worked for a really long time. Maybe it continues to work. I don't care. That's not the point, right? The point is that when you invest in an index, You get the returns of the index, which are very good, but you also get the volatility of the index. So me personally, maybe I'm just more conservative. I don't want to put my life savings into something that moves around 1% a day.

or back during the tariff tantrum last year is moving around 9% a day. I don't want my life savings in that. I don't want to take a 20, 30, 40, 50% drawdown, right? Because drawdowns affect your psychology. So, if you take a giant drawdown on your life savings, number one, you're gonna be miserable, and you're gonna be miserable until you get back up to the high water mark. And number two, there's a decent chance that you're just gonna tap out and sell and stop the pain. And that's the worst thing you can possibly do because then you stop compounding, right? But we've seen this a bunch of times before. This is the antidote to that. So instead of just being in stocks, you're diversified across asset classes, stocks, bonds, gold, cash and real estate in equal proportions. The interesting thing is, is that you're only giving up about one to two percentage points in performance, but your volatility is cut in half in the worst drawdown that has ever happened with this portfolio is down 12%, whereas about 40% for the S&P 500 in a calendar year, right? So this is the answer. This is the answer. And it's the answer, not just, you know, look.

If you buy the S&P 500 you will have more money when you retire than if you have the awesome portfolio That's if you can hang on if you can hang on But this is if you want to be happy if you don't want to be checking your account balance every day seeing what the market is doing in Panicking when the market is down three or four percent people should buy the book will include a link to the publisher and on Amazon Jared two sentiment questions for you one you made a brilliant call saying that private credit is screwed and alternative investments generally private equity and Private credit you were not a believer and I think we did that interview maybe two years ago Yeah, and I'm almost positive that pretty much every single alternative asset stock Has is lowered now than it was then We had a

washout in private credit and some fundraising issues and literally every single day It was these Bloomberg articles about private credit doom private credit doom Has your sentiment view changed given how much the negativity is has been in the headlines At the beginning of the year No, I mean, yes like yes and no I was very bearish when we talked a couple years ago. I'm still bearish I think all of this is connected AI private credit You know something else like I think it's all connected And I think if AI unwinds private credit will also or vice versa So what I think of what I told you at the time But I was telling everybody at the time is this was gonna take a long time to play out in the public markets when something unwinds There is liquidity you can sell right and the market will reprice very quickly in the private markets that doesn't happen So what you've seen in private equity and private credit is stuff just being held You know like like portfolio companies not being sold for a really long time and it's just gonna take a long time to find that liquidity So, you know a bear market in the privates It's just going to take a much longer time to play out, but we have not found the bottom yet. We haven't in private credit and private equity. Yeah. Another sentiment question for you, Jared. I'm sure you've heard the following statement. There's a bubble in the stock market, but the bubble is not in valuation. The bubble is in earnings. When you hear that, is that not just an admission that the bears are wrong, that the earnings are so good that, oh, there's a bubble not in valuation, but there's a bubble in this other thing.

I haven't heard that before, but that's a really interesting quote. Yeah, I mean, I put a I put a chart in my newsletter today yesterday about it was the S&P relative to wages and how it had completely decoupled from wages over time. But really, if you put if you overlay a chart on that of corporate profits as a percentage of GDP, it looks pretty similar. Right. So corporate profits have gone up a lot. And there are a lot of analogs to the dot com bubble 25 years ago, 26 years ago. But the one thing that's different is there are profits, you know, I mean, except for maybe an open AI and anthropic, but, you know, there are profits. So. Yes. But that revenue growth in anthropic and open AI has been tremendous. So a bear argument was like, where's the revenue in the in the.

in the labs, OpenAI, and Thropic. And I just want to say, as someone who's calling, kind of calling balls and strikes, the revenue growth has been quite, quite good. Like among the best ever for history of companies. You know more than me on that. Well, Jared, thanks so much for joining us. People can find you on X at Daily Dirtnap and we'll link to your book, The Awesome Portfolio. Awesome. Thanks, Jack.
