Ep. 374: Dominique Dwor-Frecaut on the K-Shaped US Economy, AI Supply Shocks, and Fed Hikes

Podcast: Macro hive

AI Executive Summary

1. Core Thesis

The US economy is currently in a fragile "low-high-low-fire" state where aggregate growth metrics mask significant underlying distress and labor market friction. While inflation remains elevated, the text attributes this to structural supply shocks (semiconductors, tariffs, energy) rather than demand, supported by a K-shaped recovery where asset owners consume aggressively while non-asset holders face deleveraging and rising delinquencies. Although aggregate consumption appears robust, it relies on a declining savings rate from wealthier households. Fed policy is expected to remain ambiguous in 2026 due to internal dissension, but a potential single rate hike might precede a cut cycle next year, as fiscal risks (deficit, debt) and AI capex import leakage are reshaping growth expectations for the coming decade.

2. Key Arguments & Data

- **Labor Market Dynamics:**
  - The economy is characterized as "full employment" with an Okun coefficient of approximately 2 (suggesting ~2% annual growth is needed to lower unemployment by 1%).
  - Despite low unemployment rates, the job finding rate has collapsed to recession-levels due to labor supply constraints and AI-induced hiring freezes.
  - Unemployment duration remains abnormally high for an expansionary period, indicating workers are struggling to secure positions despite low headline rates.
  - Hiring is stalled as employers use AI to replace jobs rather than add headcount, leading to a risk-averse labor market.
- **Growth and Capex Structure:**
  - High GDP growth is partially driven by imported CAPEX, particularly regarding AI infrastructure, which inflates US GDP figures while supporting economies like Taiwan and Korea.

    - Cheap semiconductor prices act as a supply shock equivalent to energy shocks (e.g., oil), impacting service sector productivity rather than demand.
    - The Federal Reserve misinterprets sticky goods prices as demand pressure, whereas the speaker views them as price impacts from supply-side disruptions and tariffs.
- **Consumption Fragility:**
    - **K-Shaped Consumption:** Aggregate consumption is growing fine, but non-mortgage consumer debt (credit cards, student loans) is deleveraging at levels comparable to the GFC crisis. Delinquency rates for these debts are high.
    - Savings Rate: Household savings rate has plummeted to ~3.5% (pre-GFC lows), down from a normal 7%. Consumption growth relies on asset owners lowering savings, not growing real income.
    - SME Sector: The small business survey (since inception) shows profit decreases consistently exceed profit increases, indicating fragility in the non-monopolistic sector compared to large SPX constituents.
- **Inflation Mechanism:**
    - Inflation remains above target due to multiple supply shocks, but the Phillips curve is flat, meaning low unemployment does not translate to high wage growth.
    - Core inflation indices show a gentle downward trend, decoupling from headline CPI; revised data suggests trends are softer than perceived.
- **Federal Reserve Policy:**
    - The FOMC has shifted from a Chair-centric model (Bernanke/Yellen/Powell) to a more dissension-heavy environment akin to the Bank of England.
    - Fed Chair Walsh's recent Jackson Hole speech signaled optimism on the supply side and skepticism on forward guidance, but his hawkish rhetoric contrasts with lack of actual rate hikes during previous high-inflation periods.
    - **Outlook:** Expectation for one final hike in 2026 followed by cuts in 2027. Internal consensus has shifted from "cuts" to "hold/hike" over the course of the year due to macro data ambiguity.
- **Fiscal Policy & Risks:**

    - US Budget Deficit is running at ~6%, with Debt/GDP exceeding 100%.
    - Treasury Secretary Besson plans bank bond buying, but fiscal consolidation and increased military spending ($500B) pose long-term risks to the yield curve.
- **2027 Projections:**
    - The primary surprise is that the AI boom will lose steam sooner than expected, with limited positive growth impact due to import leakage and labor market inefficiencies.

3. Actionable Takeaways

- **Re-evaluate Portfolio Focus:** Investors should look beyond aggregate SPX metrics to understand the "K-shaped" economy; overweight SME resilience risks over asset-heavy conglomerates (which drive the current inflationary gap).
- **Monitor Savings Rates & Delinquencies:** Watch non-mortgage debt health and household savings rates as leading indicators for consumption fragility, rather than relying solely on GDP growth data.
- **Watch FOMC Divergence:** Track Fed Chair Walsh and key dovish voters (e.g., Waller) for the next pivot point; expect a potential policy turnaround in late 2026 if internal consensus shifts toward cuts.
- **Adjust Inflation Assumptions:** Treat current inflation as a supply shock-driven anomaly rather than demand-pull pressure, meaning traditional rate hike reactions may be less likely given weak wage growth.
- **Prepare for AI Fatigue:** Expect the AI capital expenditure boom to face diminishing returns and supply-side constraints by 2027 due to global leakage and labor market friction.
- **Track Fiscal Sustainability:** Be aware that US debt and military spending plans could pressure long-term yields, requiring adjustments in fixed-income duration strategies.

Welcome to the MacroHive Conversations podcast. I'm Bilal Hafiz, Head of Strategy at MacroHive. Before we dive in, a quick update. Following MacroHive's acquisition by the BGC Group, BGC has launched a new regulated business called MacroHive Markets. For the first time, onboarded clients can also access execution services via MacroHive Markets. This new workflow will allow macro-institutional investors to benefit from strategy and quant insights, alongside access to global liquidity. Please contact Andrew Simon or Gail Mozibriyan

Bloomberg or click the link in the description below for more details on McRide markets and its service offering. Now on to this episode's guests, Dominique Dwarf-Ricot. Dominique is a macro strategist based in LA. She's currently working at no other than McRide. Before that, she worked at various hedge funds including Bridgewater. Before the buy side, she worked at the New York Fed, the IMF and the World Bank. She holds a PhD in economics from the London School of Economics. So now on to our conversation. Greetings and welcome, Dominique. It's fantastic to have you back on the podcast. Thanks, Bilal. It's great to be back on. Great. There's a lot to talk about. And 26 has really been a fascinating year in terms of all these different developments we've had, whether it's the AI story, the geopolitics story. But let's start with a here and now. And in terms of the state of the economy today, How would you characterize it, you know, whether we look at the labor market growth, composition of growth? I mean, what's the current health status of the US economy? It's a little bit mixed. I think it's a full employment economy. If you look at indicators, I mean, hard data on the labor market, it's clear there is very little slack. If you look at growth, it's been fairly stable, very consistent with a low slack economy. As you know, I've done some work on the open law. And to my surprise, you know, that open coefficient is still about two, which is amazing. And just for the benefit of our audience, tell us what the open law is and what your work shows. So it's a relationship between growth and the rate of unemployment. So This was developed by Mr. Okun. I think it was in the 70s. And at the time it was found that you needed a year-on-year growth of about 2% to lower unemployment by 1%. I think James Tobin

even had his own estimate way back when of the Okun coefficient was around 2%.

did my own computation, and to my surprise, I found the coefficient to be still too, and stable post-pandemic. And that gave me more trust in the labor market data, because you do have a big divergence between the hard measures of unemployment and the survey measures, the people's perception of the labor market, which are much more negative. You know, with more trust, certainly the Okun Coefficient gave me more trust in the hard data and it made me think that what's probably going on is that we are in a lower higher, lower fire economy. So people who are out there trying to find a job, they are finding it much more difficult for a given rate of unemployment than they would have, for instance, before the pandemic.

I mean, just a question on that. I mean, if growth is around 2%, so 2.5% today, and before the pandemic, it was around 2%, 2.5% as well, wouldn't that mean that it should be the same getting a job today versus pre-pandemic based on Ocon's law? Am I missing something here? No, it's I mean no clue about the unemployment rate. It's not about the job finding right. It's just that because of this weird unprecedented low high low high low fire, which I think you know has to do in part with AI and also with the decrease in labor supply, the fact that fewer workers available, the job finding right has I mean, during expansion, typically you see an increase in the job finding rate. And this time around, this is really unprecedented. We have an expansion and the job finding rate is falling and it's actually quite close to recession level. So it really has to do with the fact that there is much less job labour market challenge, if you will. So if you happen to be in a position where you have to get a new job either, you've decided to alter the labor force or you've been laid off, it's much more difficult to find one. And so, you know, while the unemployment rate is very low, if you look at the duration of unemployment, it's abnormally high for an expansion. Typically during expansion, the unemployment duration goes down, but this time around, just like the job finding rate, it's gotten worse.

One thing some people have talked also about in terms of this low-high-low-fire economy is that post-pandemic, the churn rate jumped up significantly as there was a big rematching of jobs, and so now there's less.

Has that also been a factor that there was this unusual behaviour after the pandemic and now we're kind of making up for it the other way? So, Chair Walsh thinks it's a factor, personally. You know, this was, what, a few years back. don't think it matters as much maybe if you were still in I don't know 2023 but you know it's 2026 it's hard to think that this big turn we had during the pandemic is still impacting labor market functioning it's possible but I think it's less important than this decrease in labour supply and also the impact of AI, which has made both employers and workers very risk-averse in terms of hiring new people and also in terms of quitting their jobs. Yeah, I think anecdotally I'd sympathise to your argument because when I look at job applicants I get at least and just generally hiring intentions of me and my peer guru.

you know, people who have the ability to hire, you know, everybody to some extent is on pause when it comes to hiring. Everyone's thinking about how can I use AI to replace the function that previously were done by people. And so I can kind of at least anecdotally see, you know, that dynamic unfolding. Now, you know, the other aspect of AI, of course, has been the whole CAPEX story. You know, the numbers have been really quite large. It's been associated also with growing revenue, high profit margins as well. And so what's your take on that CAPEX story? So my take is that actually a good chunk of that CAPEX is imported. So we like to think of GDP with what you call final demand on one side and on the other side inventories and net exports. And usually it's a good way. I mean just looking at the final demand component.

is a good indicator of trend, but this time is different because actually you can really see the surge in AI related CAPEX import. In fact, if you break CAPEX import just with the monthly trade data in two between AI related and non AI related, you can see the surge in AI, but the rest of the CAPEX import are flat or probably falling in real terms. I think this time around breaking GDP between domestic demand and external trade is probably giving a misleading picture of growth and exaggerating the impacts of AI capex. On this point about the import side, I had an earlier podcast guest some episodes ago who argued that while from a GDP calculation perspective that of course is true, you subtract imports. But when you take a global perspective, the fact that this huge capex is happening in some ways

does end up coming back to the US or affects the US somewhere along the way that we have to kind of think on a global basis rather than kind of a sort of a narrow GDP calculation perspective. So for sure.

But I would argue that the blowback to the US is not entirely positive. For sure, we are lifting. There's no question. The hyperscalers are lifting the GDP of Taiwan and Korea. So hopefully that fits through into a demand for US exports. So they're not doing that well. But the other impact, which I think you know, has been overlooked and perhaps misinterpreted or not looked at in the right perspective. It's really the price of chips. And in my view, the increase in cheap prices does much of a supply shock as an increase in energy. I mean, we can't do anything with chips. We can't work with that computer. It's not even just about goods prices, about, you know, cars. Nowadays are just computers on wheel, but even we wouldn't be able to do any service work without a computer. So to me, the surgeon's cheap prices that we've seen has been yet another supply shock. And in my view, the FOMC has misinterpreted the stickiness in goods prices as evidence of demand pressure. Well, in my view, what we've had is another supply shock after the tariff coming from this increase in chip prices. Before we go into some of the price aspects of all of this, you know, rounding off the growth conversation here, on the consumption side, reading Warsh's most recent speech from the Jackson Hole, he said, I think his term was healthy, consumption's healthy. Would you agree with that? No, I don't. I think consumption is really split.

for sure consumption on aggregates is growing fine but what the data shows is that actually a good chunk of households are experiencing distress, deleveraging and I mean be very specific If you look at non-mortgage consumer debt, so things like card, credit card, student loan, you really see a decline relative to GDP. So we do have deleveraging there. By contrast, housing debt is very stable relative to GDP. And on top of this deleveraging, we have delinquency rates on credit cards, on auto loan, on student loan that are levels comparable to what we had during the GFC. So we do have, on aggregate, a very solid growth of consumption. That's why, you know, growth, as we said, is above trend or close to trend. But there is a good chunk of people who are distressed. And so in my view, that's a key reason why the economy is not as, you know, as resilient as people think.

So the second underlying fragility in terms of consumption and growth, and remember in the US, consumption is 70% of GDP. So the other factor is that if you look at consumption, what's driving it is a decline in the savings rate, which is now close to the pre-GFC laws. I think it's about 3.5% before the GFC got as low as 2%. a normal savings rate for households in the US is about 7%. So we've had a decline in the savings rate that has offset a very slow decline in real consumer income. And in the past, whenever we've had a decline in our flat real consumer income, we've always had a recession. So that's the other factor of fragility is that And we don't want to have real consumer income growth. So is it fair to characterize the US economy as those parts of the economy, whether it's businesses or individuals that have assets, whether it's housing or equities or data centers, they're doing very well. But the ones without assets are not doing so well. So you have this two-tier or K-shaped economy. Very much so. On the business side, I would say it's those who have balance sheet are running debt. And that's basically what's supporting the AI capex. And on the consumer side is those with assets are able to lower their savings rate and supporting consumption in that way. And it doesn't make for very sustainable growth. Like if you have a big shock to the economy, say, if you had a big and prolonged equity sell-off, you know, you could have a recovery in the savings rate and those household driving growth would simply stop consuming. And if we move over to the inflation side, inflation is still running above the target of the Fed as the Fed has been saying for many years now. So given this fragility in the economy that you've described, I mean, why isn't inflation closer to 2%? Why isn't it 2%? Why is inflation running high still? So first of all, inflation adjusts.

slowly, monthly, we get monthly data. It's not just that we get monthly data, but for inflation to adjust, businesses have to slow down the pace of increase in their prices. That has to get reflected in wages. And that process, unlike financial transaction or portfolio adjustments that literally takes place at the speed of light, you push the button and the market moves. That economic process is very slow. So that's other things, economic time is much slower than market time. And then the other issue is that we've had a series of supply shocks. We've had the tariff, we have the chips, we have energy. So the problem with supply shock or the problem with inflationary shock in general is that it takes a while before you can figure out if what

you are dealing with is a relative price shock. I guess it's fancy way of saying an increase in the price level or an increase in the rate of inflation in the initial stages of the shock. Those are observationally equivalent.

My personal view is that what we are dealing with is a series of supply shocks, but because the Phillips curve is so flat, these are not so many that despite the low level of unemployment, wage growth is very weak. which is why real incomes are flat or falling. So these supply shocks are not getting transmitted to the economy and you can see it in the inflation data. Now it gets a little more complicated because of peculiarities in the way the PC index is computed. You've had a decoupling of core PC, core CPI. Those are going to be addressed in data revisions that are coming this month. But if you look at indices like trimmed means CPI and PC, median price CPI and PC, or the New York Fed, MCT, which is trying to identify the persistent components of inflation. You clearly see that the trend is down, but it's a very gentle trend. Okay, we might as well go straight to the Fed then, given this context that you provided. And obviously, we've had a new Fed chair, Fed chairs, or WASH. We recently had Jackson Hole.

And so, you know, before we go into his outlook on what you think the Fed will do, what do you think is your current understanding of how the Fed behaves now? You know, because, obviously, Warsh is talking about dropping forward guidance. You know, he seems to want to shake things up. But we've had various testimonies. We've had Jackson Hole now. So we've had a couple of months to kind of assess him. So what is the Fed like now? So it's a little different in the sense that I think the Fed is becoming closer to the Bank of England maybe in terms of the open dissension between the FOMC members. So before we had a very chair-centric model, you know, you had chair like Bernanke Yellen, who had amazing academic credibility, so there was an aura around them. Then you had Paul, who wasn't.

as academic but I think was a really good people's person so invested a lot of time in convincing FOMC members of his views before the FOMC and he said so and he said several times you know if you take the time to listen to people to make them feel that they are being heard then they'll come around which I thought was very telling and now we have a disruptor. who wants to have good family fights. So before, my fan monitoring was really

about following a few what I call chair whispers. People close to the chair. Now I have to follow every FOMC voter. Also, I think the influence of individual voters depends, which is a good thing, on the quality of their view, like someone like Waller.

who has a full-fledged economic view, is going to be more influential than Dove's with less of an economic view. So, dare I say, this is a return of the economists at the FOMC. So that, I think, is a key change. Other than that, we have a share with different views besides the... No guidance is very focused on the supply side, much more so than previous chair. So for instance, there has been a much discussion of his hawkishness during the GFC. But the hawkishness seems to have been driven really by his pessimistic view. of the supply side of the economy, then if you read his speeches, that really comes out clearly. And now his view of the supply side is much more optimistic. That said, I thought so the speech.

was really good because he realized that some of his initial positions, like I am not giving any forward guidance, not on policy, not on my view of the economy, not on my reaction function, his initial views as I would say nothing, and in the speech. You saw him give a full-fledged economic assessment because he's realized that he can't do his job. The Fed can't do his job without a market understanding of how the Fed use the economy. So we had a disruptor. We had a disruptor. But who is willing to change his views if he thinks that there is a need for such a change? I mean, one thing I found a bit surprising, at least in terms of So rhetoric is that he came in hawkish. He keeps talking about how high inflation has been for like the last five years, having little digs, you could say, towards Powell. Yet he hasn't hiked, you know, at a number of instances where he could have hiked. So why do you think he just hasn't hiked? I've always said that the fair share before getting the job, the potential fair share views are going to be different.

from his views after getting to the job. Now, he's the chair. It's not about getting the job, it's about his historical legacy. And to be clear, I think some of the things he wants to do, like excessive forward guidance, I think better rules for using the balance sheet, I'm 100% for it. So some of the challenges in my view are very beneficial. I just think that the incentives once you are

appointed are very different from incentives when you are trying to get the job. And now I do want to give a time stamp for our listeners. We are recording this on Tuesday, the 1st of September. So this was after the Jackson Hole speech, but before the Waller speech that will have happened by the time this podcast gets released. But assuming that doesn't change things too much, what is your fed outlook for the rest of this year and as we go into next year as well?

So for next year, based on my inflation views of the flat Phillips curve, assuming no new supply shock, I do think the Fed is going to cut. This year, it's a little bit trickier because the data is fairly ambiguous. We have this inflation, but it's very slow. At the same time, as you know, there is no... easy way of measuring the policy stance. Our star is model-dependent as Powell kept telling us. You know, you can't navigate by the stars or you can't get real-time measures of, you know, your star, our star. But so we don't know. I personally think that policies restrictive enough to go back to the target, but I'm not the one making the decision. It's the Fed. So one of my core beliefs in covering the Fed is to try to think like them. So rather than try to predict what...

to, you know, to argue on what they should do. I would rather focus on what they are likely to do. So if you look at the number of voters, my view is that there were only five voters in favor of a hike this year. until Jackson Hole, the Fed, speak data, including the minutes, suggested that the median FOMC voter had become more positive on dissentration prospects. But then you had Warsh turning negative, you know, more hawkish. And Warsh is smart. He will have anticipated the market reaction to his speech and the fact that it set him up. for a hike or no hike and losing credibility. And he will have also anticipated that perhaps from the White House there would be less than well positive noises about a hike. So I suspect his way of handling the common drums that he's created with this hokey speech.

is to leave it to the FOMC voters to decide. And that's why I think Waller's speech is going to be key because it's one of the more influential doves. If he turns, previously he had said that he's in July. He had said his base case was still on hold through the year. If he turns, I think... other doves will turn and there will be enough votes for Walsh to say, I have to go with my

committee. We had the family fight. We ended up on the side of a hike and I have to go. Okay, so there's supposed to be one more hike this year and then next year they start to reverse those hikes. One thing I do have to ask is when I look at consensus over the course of this year, And at the start of this year, many, well, the consensus of economists from all the big banks was to look for cuts by the Fed this year. You also were looking for cuts as well. And now you, along with many others, have sort of flipped to say either on hold or hike or two. So there's been this big kind of shift over the course of this year. So you kind of representing the community of economists. I mean, what do you think everyone got wrong at the start of this year?

So I know what I got wrong. I'm not sure about others. I mean my big fear at the start of the year given the fragility of the consumer and also the fragility of the SME sector that doesn't get enough attention because everybody is focused on the SPX and the SPX is doing so well. But the reason the SPX is doing so well is we are in a highly monopolistic economy. So those guys, those SPX constituents, they are attracted all of the surplus in the economy. And the flip side of the high profitability is the SME sector that is really hurting. If you look at Fed surveys, for instance, or even the very, very strange small business survey, did you know that in that small business survey since inception?

in 1984, the share of respondents who reported a decrease in profit has been consistently larger than the share of respondents who reported an increase in profit. So with those fragilities, I saw the economy highly exposed to a shock. And with the war, remember the initial stages of the war, there were risks of a sharp increase in all prices, but we're talking about an increase comparable to 208 adjusted for inflation, which would have been something like 250 a barrel. And now with the benefit of hindsight, it seems quite laughable. But at the time, people were not laughing because they thought we were going to lose 20% of our supply. It turned out we did not. Also, China reduced its import, which I don't think anyone was expected at the time. But I thought that if we had such a big disruption in energy markets, given the underlying fragilities of the US economy, we would probably have a recession. And whenever there has been a recession, even in the 1970s, the Fed has always cut. So that was a reason for my initial expectations of cuts. And it's not just analysts who got that wrong. If you

look at asset manager or hedge fund returns around the same period, they also did poorly as well. So a lot of people do.

got that event wrong as well. Now, another recent policy development has been Treasury Secretary Besson talking about buying bank bonds. Numbers are small, but there's been some obviously focus on the signal rather than the scale. What's your interpretation of that? Is that something significant or was that just noise in the grand scheme of things? So, if you are an asset manager, It's very significant. Yesterday, Secretary Besant gave us an interview at G20, where he said, basically, markets take notes. I'm going to make sure this is not a one-way bet, and I have an informational adjustment advantage over you. I'm the house. Remember, the house always wins in the long run. So if I am an asset manager, of course, I have to take this.

super seriously. But my perspective is more long-term than of an economist. And the reality is that the US is running a 6% budget deficit when unemployment is at historical lows, that the debt to GDP is already above 100%. horrible stats. And then in that same G20 speech, Bessin said, yeah, those fiscal consolidation measures I mentioned a week ago, they are coming. But you know, a few weeks, maybe a few months, he did actually said in a few weeks or a few months. And you said those comments against the administration plans to increase the military budget by 50%, which is 500 billion, or about one and a half percentage point of GDP. every reason to expect that rights, you know, from a long-term perspective, probably have the long end of the curve, especially, which is, you know, more driven by long-term factors like fiscal sustainability. Well, I mean, it's not looking good for the long end from an economic perspective. And just I wanted to round off with one question, which is obviously we're not.

quite at the end of the year, but if you had to pick one big surprise for 2027, what would that be? So, we're giving listeners a preview of our grace ones. I suspect the surprise is that the AI boom is going to run out of steam, but the surprise could be the limited impact on growth, much smaller than people would expect. OK, now that's provocative. And this goes back to your point around the import leakage that you get from the capex side. And also, you know, the impact, the negative supply shock from the cheap prices and also the impact on the labor market, which is a bit frozen because

people are afraid to hire and quit. And it's not very good. It's not good in terms of allocative efficiency. It's not good in terms of labor market resiliency.

So. Okay, that's great. And then final kind of question that this is more for our audience. What's the best way for people to reach out to you or follow your views? All my views are on the Macohive website. I always love to have a chat with people so I can be reached very easily to ourselves, people, or directly. So it's all with macohive.com. Great. No, I appreciate that, Dominique. So once again, thanks a lot for those insights and keep up the good work as well. Thanks for listening to this episode. Please subscribe to the podcast show on Apple Spotify. You'll be able to listen to podcasts, leave a five-star rating, a nice comment, and let other people know about the show. We'll be very, very grateful. Sign up for our free newsletter at macrohide.com.
