

PATIENCE IS LIKE A MUSCLE

(Guest: Leslie Harris)

Podcast: Market huddle

AI Executive Summary

This transcript features a detailed discussion between two traders (Patrick and Kevin) regarding market technicals, commodity trends, and macroeconomics. Below is an explanation of the technical concepts mentioned and a summary of their arguments regarding specific asset classes.

1. Understanding the "Bullish Percentage Index" (BPI)

The conversation begins with a clarification of what the **Bullish Percentage Index** actually measures.

- **The Misconception:** Many traders mistake BPI for a **sentiment survey**—a measure of how "bearish" or "bullish" investors *feel*. They assume that if the index is at 0%, it means everyone in the market is panicking and looking to buy.
 - **The Reality (Technical Indicator):** Patrick explains that BPI is a **technical breadth indicator** based on price action, specifically using **Point and Figure charting**. Instead of measuring time, this method measures sequences of price movements (X's for up, O's for down).
 - **Why it isn't "Sentiment":** The index simply counts how many stocks in a basket have triggered a technical signal (e.g., a lower low in the sequence of O's). If an entire sector is in a downtrend, the BPI will drop to near zero because the **price patterns** are bearish, not necessarily because investors' opinions have changed. A low BPI often just reflects the ongoing momentum of a bear market rather than an "oversold" opportunity.
-

2. Gold: The "Ugly" Chart

Despite being a long-term "gold bug," Patrick presents a bearish short-term outlook.

- **Technical View:** He describes the chart as "**distributive**" and "ugly," noting that gold is making lower highs and lower lows. He argues that the recent rally is "borderline pathetic" compared to other market bounces.
 - **The Requirement for a Reversal:** For gold to turn bullish, it needs to reclaim the **\$2,450–\$2,460 area** and break above its 50-day moving average.
 - **Strategy:** Because of the downside risk, he advises against being "**delta one**" (being fully exposed to every price move). Instead, traders should use an **option overlay** to protect portfolios from volatility.
 - **The Counter-Argument:** Kevin notes that the traditional relationship between a strong US Dollar/high interest rates and falling gold prices has broken down recently due to massive central bank buying.
-

3. Oil: The "Liquidity Cascade"

The discussion moves to the recent, sharp decline in oil prices.

- **What Happened:** Kevin describes a "**liquidity cascade.**" A peace deal (which many were skeptical of) caused a rapid repricing. Traders who were "long" (betting on higher prices) were caught offside, leading to margin calls and forced selling.
 - **The Role of the SPR:** Patrick argues that the **Strategic Petroleum Reserve (SPR)** was effective in neutralizing immediate supply threats. However, because the US depleted its reserves, there will eventually be a structural need to replenish them, which could drive demand later.
 - **Outlook:** While the "blood loss" (immediate supply crisis) is over, the system is still "depleted." The long-term view is bullish due to replenishment needs, but the short-term view remains uncertain as traders settle their positions.
-

4. Energy Stocks: Structural Bull vs. Tactical Pullback

The speakers debate whether it is time to exit energy stocks (like Schlumberger or Halliburton).

- **Long-Term Thesis:** Both agree that we are in a "**post-war regime**" where energy demand and strategic importance are increasing, moving away from the ESG-focused era of the last decade.
 - **Short-Term Concern:** Patrick warns that even though the long-term story is strong, we are seeing a significant pullback on monthly charts. A "summer of consolidation" or further 10–15% declines could occur before the next leg up.
 - **The "Funding Trade" Risk:** Kevin suggests that hedge funds might be using energy stocks as a "funding trade"—selling these winners to buy other, more expensive sectors.
-

5. Semiconductors and IPOs: The "Boiling" Bubble

Finally, they discuss the current state of the tech/AI boom.

- **The Bubble is Not Over:** Contrary to theories of a "blow-off top," Patrick observes that even after massive parabolic moves in stocks like AMD, investors are still "buying the dip."
 - **The IPO Cycle:** Patrick points to a massive influx of capital via new IPOs. He compares the current market "froth" to a hot tub that is about to start boiling.
 - **The Timing Problem:** The central challenge for traders is **timing**. While they both agree that the current level of euphoria is unsustainable and could lead to a crash (referencing the 2000 Dot-com bubble), they acknowledge that the market can remain "irrationally" buoyant for many months or even years before the actual collapse occurs.

Full Transcript

Hit it. It's Friday, June 19th, 2026. Episode 294 on Patrick Serezna. And I'm Kevin Muir. This week, we welcome back to the show Leslie Harris. We talk about his years trading with Morris Sacks. We put him on the trading couch and hear what mistakes even the best professionals make. And then we learn what it was like to be 17 years old, going to CBGB's to watch the Ramones. Then Patrick weighs in with this technical take on this topsy turvy markets in talking charts.

And, uh, this is normally where Danny, you'd come in and describe the beer, but, uh, we all dropped the ball today. Like, uh, it's an early morning recording. And, uh, what can I say, Patrick? No, I'm going to drink later. It's a little early. Like everyone, I mean, it's five o'clock somewhere in the world, but it's not, I'm not going to think. Anyway, okay. No beers today. No beers today. Let's see. Let's get to the disclaimer. Um, nothing in this podcast should be viewed as investment advice. Listener should consult an investment professional before making any decisions regarding topics mentioned in the show. So it affects a too much. I don't may include the oil market bipolar syndrome higher for longer hallucinations and the worst shock syndrome. Oh, that sounds actually like, uh, we should, we should remember that one. That's a, I suffer from that syndrome all the time. Well, I'm going to probably start anyway. Let's get to the guest.

It is my great pleasure to welcome to this show somebody that we haven't heard from for a while, but I've been in touch with and I've just considered my friend a great mentor, somebody that I really enjoy talking to Leslie Harris. Leslie's had a long career in financial markets as a global macro trader. He started at the Comex and ended at the fabled Greenwich Capital and is now in private practice as an executive coach, but he's still very active in the markets. Leslie, thank you for coming today. Thank you, Kevin. It's a pleasure to be here, my friend. And before we start, I'd like to thank you and all the folks in Toronto for trading O.G. Ananobe to our New York group. We are eternally grateful for your generosity, and we're humbled by it. And we're really excited. So thank you. Thank you all. We only do it for good fellas. So thank you so much. It's a great way to start.

You know, I mean, just for those of you who are not like in New York, and don't can't comprehend what this championship has meant. And the city is just going crazy. It's fantastic. It's like nothing broke the city this close together in my lifetime. And I'm here my whole life. Oh, wow. It is that big a deal. It is that big a deal. It is that big a deal. It's everywhere. Like people were losing their minds. The city is just totally falling in love with the team. And it's just Oh, it was a great team. It was a great, uh, champion. So yeah, no, completely great. Well, anyways, congratulations.

Thank you. Thank you. So I haven't been on this thing for a couple of years and I was very nervous coming on for a couple of reasons. One is I got like really hammered last time. Like I embraced the uh the dreaming part of the program uh a little at excess but you were trying to look to use one of my quotes uh in your you know the macro tourist and kind of thing and one of my clients obviously uh a subscriber said hey you know you should go back on that show again you were great that it says no no and then I asked my wife and my wife goes Yeah, you should go. You were great. So here I am. I'm going to try to stay sober. But that said, the beer we're drinking Patrick today is a Thai bottle from Spring Brewery and local to Long Island where I am at the moment. And it's an Alpine Pilsner recommended to drink fresh and cold. So that's what I'm going to do. So cheers. Cheers. I am not drinking. I am making falling down on the market. That'll tradition. But good for you, buddy.

Well done. I, you know, I skipped the backup bottle of rye, which I think has gotten me really in trouble. Well, the thing is, last time it was so long ago, it was November 21, it was in the midst of COVID. It was COVID. Yeah. It was 100% COVID and there was no video. So it was just audio only back then, right? So you could just be pouring drinks and drinks and drinks. No one knew what a lush you were. We'll do better today. So one of the things and for those who want to know more about your background, I highly encourage you to go listen to see how liquored up Leslie did get in the last one. You can find it on YouTube. But in the meantime, one of the things that you were more than kind enough to volunteer is to grab to get a seat on the trading couch. Yes. Yes. Right. I have to say to your credit, the podcast lately has been fantastic.

Like I said, my client said, you should get on that trading couch. You're always talking about trading. So yeah. So last one that got on there was Tony Greer and we're going to get you on. So we're going to start with, I don't know, where should we start? Let me just think about this. Okay. I'm going to say something nice about you first. Okay. You always talk about at the end of the program, you know, so nice being along this whole ride, friends, whatever. And, but it's really true because The reason I am on here is we and our friend, our common friend, Mara Sacks, who unfortunately passed out a year and a half ago, he turned up in your comments and you were kind enough to invite him on and he crushed it. And then he came on again, I think. And then it led to him and his friend Liam having their own podcast, which became very popular. And you got a lot of traction on that as well. And I know it's very meaningful to him.

doing that podcast. It really meant a lot to him. And then when he faced his health challenges to work, you know, I knew that the podcast really sustained him. And I really believe added years added time to his life. So, you know, that act of curiosity and kindness on your part actually had a very impact on somebody else in a more meaningful way than you can realize. Well, that's very kind of you to say and obviously we all miss Morris deeply and I still get people that reach out to me and say, you know, you know, I loved listening to Morris. I'm so sorry for your loss. And I say it's everyone's loss because he was truly a wonderful person that made the world a better place. And he was and as a market professional, you know, really one of one, you know, a great unique and, you know, coming, we're getting this out of the way because in talking about my own trading and my own career, his name is going to come up a lot. Just be right. Okay, well, we're not going to get it completely out of the way. I'm going to put you on the spot. Your favorite fun Morris story that folks might not know. I haven't given you any prep for this. So you I'm going to speak a little bit as you think here and going for a second. Yeah. This isn't a favorite, but it's more great.

But it wasn't all like, as someone would say, ice cream and unicorns. There were phone smashed and there were screen smashed. But when it was happening, it was almost like a SWAT team would come in. It would happen and then there would be like five people there and within 30

seconds and everything was as if it was before. and you made a way he smashed enough screens that they had like a like they were like they ran the playbook like like you know when you see f1 and yeah yeah all right and then i'm gonna ask you put put you on the spot again for one more story if you had to sum up morris and his character in one story do you think either something that you can uh that strikes, you know, a moment in your mind that you think about, like, if I had to tell one story that really explains who Morris is, what would the story be? I would say two things. One is, like, the thing that made him unique to me, and I think his professional was, he was a great trader, which, you know, there's a lot. I mean, but he was, the P&L speaks for itself. He was a great trader, really, really smart. And he was a great trading manager, which most great traders are not. And I'll get to that in a minute.

And he was a great risk manager. So it's like, you know, very rarely see all three of those traits. And that's what made him unique. But I would say that we worked in a, you know, trading was, it was a lot of money at stake. It was high stakes, you know. And, you know, if there was ever, there were uncomfortable conversations that happened, but they never happened on the trading desk. If it was an uncomfortable conversation. It always happened off the trading desk and that might have been about your wrist, it might have been about your positions, it might have been whatever. And it might have been about your behavior. Like, you know, sometimes bad behavior was half. And, you know, he would very calmly call you into an office and it would be very clinical, transparent conversation. I think that speaks to his character as a person as well.

Well, that's terrific. And as we say, as you said, we're going to hear a lot more about Morrison and the influence he's had over you over your career. Let's start with a couple of trick questions for five minutes. It was actually let's start with a couple of quotes that I grabbed from the last interview that we had. And if you said something, you said you only need to be right three or four times a year to be successful. You know what you mean by that? And did you explain to folks like how that is elemental to your trading philosophy? Well, I mean, it's elemental for a couple of reasons because I believe that to be true. And I think most people spend a lot of time over trading to begin with. And I think when I work with some traders now, and

if I can get them to trade less, wherever the baseline is, P&L and fruits. And it doesn't mean it means that you have to be patient. And, you know, and when you when you have it right, you're fucking supposed to maximize. Right. And if you can maximize three or four times a year, and just sort of whatever, you're going to end up with a pile at the end of the year. And the idea is just to be patient. And again, you got to, you know, I often say like the markets try to beat you.

And your job as a trader is not to take the bait because you're not a fucking trap. That's why. And the thing to do is to be patient. And when you see it, when you see it, get behind it and maximize it. And that's hard to do. But I do believe that because I think a lot of times people are in it day in and day out and they're wasting time, wasting mental capital, wasting financial capital. And, you know, I say to folks, you know, patience is like a muscle. You know, you got to exercise it. You got to use it. You got to develop it. It's like, it's an important thing. And people don't, like, if you could be more patient with your trading, you're going to be more successful. And then for me, so, like, I used to try to wait around or if I saw something, I, back in the day when I was good.

uh, I was able to see when Marcus was starting to turn and then I would like, if I got him early, I always was adding to winning trades. And so I always added to winning trades and then you got to be able to get out at some point, which I'm not always successful doing, but you know, you know, the, uh, I'm going to, I'm going to interject my own, uh, more story here because, uh, he used to, he used to send me notes and he'd be like, You're writing too much. Nobody can possibly have that many good ideas. You got to, you got to trade less. You got to write less. Like that was his thing. And he was very much in the same mindset as you. And one of the other quotes that I love that you said is patience over discipline. And I guess what you're saying there is that it's easy to, you know, cut your loser short and do that. But that's not as important as actually trading less and being patient and waiting for the right trades.

Yeah. And I would often say, and I say it to people I work with now, sometimes like, if you, whatever your baseline is, if you spend less time in front of the screen, you would be more successful. I think that's the

university. Really? Yeah. Yeah. And that might mean, that might mean not like you're living in a closet, but it may mean in the course of the day, don't pick up your sandwich, don't have it delivered, get away from the screen for 15 minutes, you know, take a walk around the block, you know, go get your dry clean. So I have something I have to confess here so apart from you know my global macro longer-term views I also punch around stocks and I've looked at my trading throughout the years and I'm like every single afternoon I just have a bad afternoon like I just if I'm gonna get into problems it's gonna be in the afternoon and I would I always tell my wife I go you know I should just stop trading in the after this right and it's and And I would say, I'd say like, I should just stop. And she's like, well, why don't you? And I'm like, well, I don't know. I just, I don't know. And, and I recently, I did it. And I'm like, Oh my God, my life is so much easier. Like I've been, I've been making things harder than it has to be. And it's not just you. I, I, like, tell people, like, you're not the only person who sent to me. I always lose money after two o'clock. I say, go home early. Like, it's like, not that complicated. Okay. So, so.

You heard that from other traders? What do you think the reason for that is? Tell us. You've been around, you've seen some markets, you've seen human emotion. Is it the markets are different or are they not taking their losses? What's contributing to those bad afternoons? I think a lot of it is like, some of it is like self-regulation. The markets are sort of, like I said, baiting you there. It's very stimulating sitting in front of the screen. It's very stimulating banging around five-year notes. It's fun. You know? What's a meaning? You know? Again, we'll bring up Morris. Morris used to have the movies on all the time. And he would say he had the movies on, because if we were watching, you know, Pladiator, we weren't even stupid shit. And she was right.

And but I would say even now, like I said, I have clients who are traders and like just trade less like where wherever it is, just do less and leave early if you got to. I like it. It's very stimulating. I think it's like you have to figure out how to self-regulate and just recognize what's going on in you when when it's happening. Like what's why are you buying that, you know, couple hundred lots of whatever, you know. Well, that's you you're trading you're trading the two and three hundred lots of five years. I'm tossing

around fides and tens It's not even it's not even the amount it's it still taxes you mentally in the same way. Oh Completely agree. Yeah, it's not the size. It's what's going on, you know between your ears Okay, so you've mentioned something that you've you've you're coaching some traders and one of the things is you tell him By the way, because like I wasn't working with that traders. I've generally had been working with like senior leadership kind of people. I've, you know, partners in law firms, CEOs in the mineral and gas business, very interesting bunch, by the way, architects and that, but Mars started talking about me on his podcast and people started reaching out. And so I have like a bunch of pms and a bunch of hedge fund. Yeah.

You mentioned that I'm not the only one that's talked about trading in the afternoon and losing money. What are the other themes that you see running through your trading clients or your portfolio manager clients that is kind of a recurring theme? You know, the notion of what I would call marginal trades. Like Morris and I, you had a lot like Morris used to say, like, you got to love your trades, go through your portfolio. You don't love your trades, get out of them. And we had like a shorthand where we'd say like, you know, no marginal trades. And they're no marginal trades. And Sony reached out to me, not a client, but somebody in a drawdown wanted to talk to me like sort of exploratory. And it's trader. And the trader says to me, like, you know, I'm losing all my money on my tier three trades. And I go, tier three trades.

It's like, well, no tier three trades. It's like, there's no crying in baseball. Like, you're by your own admission, you're like, by your own admission, thanks to like, Oh, I'm losing money on the crappiest trades in my portfolio. Like, yeah, that's right. You should by your definition, you shouldn't even have tier two trades. Absolutely. Absolutely. You should have really big, you should have really big tier one trades and hope they work out. Okay, that's great. So let's keep talking about the current market and you've seen a lot of changes throughout the years, right? This is a fascinating time to be alive because markets are changing in ways that seem crazy, but maybe they're not. So let's just start with this. Has the market become smarter or let's not use the word smarter. Has the market become more or less efficient?

than 20, 30 years ago? I don't know. I think what's changed the most, it will go from the micro to the macro, but what's changed the most is like, let's just bundle up technology, barriers to entry, and electronic training. So if I was capable of multitasking, which I am not, in the course of our conversation, I could pull out a device called an iPhone and open up something called an app. and trade a couple of million dollars a dollar a yen if I wanted to. Like back in the day, Stan Druckenmiller had to call the desk, get a price, and execute. And this is so I can do it. No is the, no attachment to any financial firm. I can just do that. So that is a profound change. Now, I think to democratize the macro size, the markets is a good thing. But I think everyone should have access to that.

But you know, you know, you can drive like there's a Chris Rock line, you know, you can drive a car with your foot doesn't mean that it's a good idea. You know, it's like, you know, there's a lot of people that have access to the markets now, I'm just not sure it turns out right for everybody. So that's, that's a big change. And the other the other thing is like, access to information, like, look, you're a guy, Kevin Muir, lovely guy from Toronto, you you produce content. video content, audio content, reading content, sub-stack, whatever. And you have an audience, and then someone like me, I have your sub-stack, all your content, I have all your competitor stuff out there. Information is really important. Like, think about this. Back in the day, because I'm an old guy, if I wanted to know what Stephen Roach thought about China, I had to be a big client of Morgan Stanley.

and some salesman would wheel him up to my office and we'd sit down and he'd tell me what he thought about China. I want to know what Steven Roach thinks about China today. I subscribe to his self-sac. That's all. Right. You know, you have access, so information and research, like, think about this, you're old enough to probably remember waiting for didn't Dennis Gartman's... Oh, yeah. ...talking to the portal. Like, that was a big offend, like, you're getting there. The facts. It would come in the facts, or the teletype, or whatever it was. Yeah. You know, that's a big change. And this is, I think, a very important change. And this is, you know, again, what Morris would call the professional trading community. And this, I'm not in love with, but the professional trading community has gone from a revenue

producing model to an AUM model. I look at the two and 20 models, just for example, the emphasis is all about the two and not on the 20.

And I don't think that's a great thing because I think what it's doing is really marginalizing returns across the board. And these firms, these enormous firms, they're optimized not to lose money, not to make money. And I think that is sort of, I don't know if that makes markets more efficient or less efficient, but it makes it different. Well, to that end, it almost feels like the moves are more violent because of that willingness or sorry, that desire to cut losses so quickly, right? And in strange ways, like to me, I'm worried the market's become way more unstable than folks realize because- I think so too. I think so too. Okay. Why do you feel that way? And like what would be, what is your, you know, nightmare scenario that keeps you up at night in terms of the markets. Oh, there's so many. What do you want to start? Well, you got to get to sleep sometime, buddy. No, but in terms of my favorite child, you know, I mean, I think again, like there, I think everyone should be able to do whatever they want in terms of access to the market. But I've been around long enough and I've seen this kind of fraud going on where where it ends bad.

I'm not saying it's Robinhood or zero-dated options. People can do all that stuff. But I just don't think it lends itself to a stable market. And I think the effect of fraud in the markets is worrisome. Okay, we'll get to your views a little bit. So let's just keep those to the side and we'll finish up with the couch here. Okay. How do you think about the difference between a bad trade and a bad outcome? Or like a bad trade and a losing trade, then maybe is a better way to explain? Well, I would say inherently a, you know, losing trade is a bad trade. But I would say if you would Like I think being early and long is the same. I think giving back money is the same as losing money. I think that's the nature of the beast. I do think though that if you put a trade on and you've gone through your work, you like the word process. I know that, you know, Morris liked it. And you go through your methodology or who you are, the filters by which you make decisions.

It doesn't work. I mean, that's trading. You know, it's like, you know, that's just trading. Like, you know, not only trades are going to make money, you know, like, you know, it's like, you know, God answers all your prayers.

Sometimes the answer is no, that's all, you know, that's the way it is. I mean, so losing money trading, that's part of the thing. And like, I think I said this on your podcast or somewhere else. And you have to like your losses because it's part of the part of the game. You know, it's like it's, you know, some, a seasoned trader who might have been when I was starting out, who might have been 32 at the time, you know. And when I was from May or something like that, there was man, that's, you know, said to me, and you seem like a dog said to me, like, you got to learn to like who lost like, you know, like I was upset, I lost the money.

And he was right. And over time, I did learn to like my losses because it's part of the, you know, it's just part of what we do. And, you know, it's losing money on a tier three trade. That's a bad trade. But that's okay. So I was gonna, well, my next question was going to be, how do you handle when you have a bad trade or a losing outcome for what you view as a good process? But I think you've already explained to me that it's a change in how you view that loss. And I think there's a bigger, I should say philosophical idea here. And you have to look like any particular trade, and I would say any particular day trading is irrelevant. It's like you want to see your career and your trading is a long continuum.

And on any given day, any given trade doesn't matter. And you're going to have to do a lot of trades, and a lot of them are going to be losers. But you want to sort of think about this through the long lens of your career and the long lens of your trading, because you're going to be trading for a long time. And guess what? You're going to have drawdowns. And you're going to have a month where you think you're the stupidest guy in the world. And you've got to be willing to accept that if you want to participate. Okay, you mentioned your 28 year old self. What would you tell your 28 year old self that he wouldn't believe yet? Like if you could go and go back and, you know, at this age and with all the wisdom that you have today? It would be a lot about that. It would be about patience and about the long lens of your career and about not getting caught up like it. Like I sound like, you know, I've only figured this out after 40 years.

Like, I didn't figure this out 20 years, any either. But, you know, it's about patience and about, like, really, like, you want to, like, think about this, you

know, where you want to be in 10 years. You know, you should hopefully still want them to be do this. And, you know, that's the most important. And that's all about patience and about not, again, not getting too caught up in the moment or in any particular trade. Yeah, I think back to my 28 year old self and because you're only 28 it feels like a year is forever And I was like oh man in the grand scheme of things like I look back Leslie at my career and I was like I was frustrated that they wouldn't let me trade stuff and I look back at the shit that I was doing and I was like I would never let a 28 year old punk do that It's inconceivable I'm the same way. I was like, I can't believe they let me do this. No wonder they shut like, they eventually were like, we gotta write this in. We can't have some crazy kid doing this. Like, listen, we were making tons of money, which is why we kept getting able to do it. But ultimately you can't have that, right? Like, and I get it. You know, you just can't have the equity derivative guy wandering into some square and going, Oh, I really like this. And I'm going to, you know, strap on a whole bunch.

Exactly. I mean, we learned a lot. I mean, you built your risk tolerance, which is good, but he doesn't like not necessarily a great idea. Okay. Um, let's talk about how when you're in a trade, do you, how do you know when your judgment is compromised? Like, do you have personal tells that on your part that you say, Oh, I might be wrong on this or I'm thinking about this wrong in terms of like, how do you Get this feedback mechanism, you know within yourself to recognize when that when you're not thinking straight it's um, it's really good question. That's a really hard question and I would say that you actually always have to be I maintain a very vibrant internal dialogue with myself about my tricks and what's going on in the markets and I I'm always, I'm always trying to notice how I'm feeling. I'm always trying to self-regulate. Sometimes I think like, what is the guy on the other side of the trade thinking? Like if I'm short something and working like I said, well, what's the guy who's long list? Like, what's, what's he thinking about? You know, or she, yeah. And I do that sometimes like, you know, well, I'm either right or wrong or if things run against me like, okay, like why, why am I, what am I doing?

But I think that also like notice what's going on in your body. Sometimes there's like how tense you are if you're being short with, you know, the

people around you, your colleagues, you know, if you if you're breaking a phone, if you're breaking a phone, probably you probably you need to sort of pay attention, you know, and I broken phones too. It's like, when you see someone do that in a trading trading, it's like, he's not having a great day. So, so do you, when you recognize it, do you ever just say to yourself, I got to get out of this? Like, is that ever happen? Not often. Okay. But generally not because I, like I say, I, I'm very, when I, when I put something on, I'm generally very committed to see it to the end, you know. Okay. I always tell people that if you're having doubts and you're having worries and you're asking some people what, what they, what you should do, I'm like, have it.

Like, I don't know the answer. I say sell a third. Yeah, okay. Sell a third and see how you feel. Exactly. And then sell some more. Exactly. And then next thing you know, you're down to like, you have no position, you're like, you get off the sheets and you go, shit, that wasn't as hard as I thought it was. I mean, I play this, you know, occasionally. because I don't entertain these calls very much. People ask me about their PAs or people who work for companies where they got have options and all of a sudden that they have these big positions and some technique. And they say like, you know what I do? It's like sell a third, see how you feel. Sell some more. And again, in terms of not that I really do not talk to retail people, but it's like...

There's a famous quote from the guy from NYU, Oshla, whatever his name is, he's a writer, the value professor there. Yeah, for sure. Yeah, because like, you should own as much as you can sleep at night. If you can't sleep at night, your position is too big. Right. And, you know, and I think that's true for professional traders as well. Okay, have you ever been genuinely scared of a position you've had? the position I've had like it's been so large you've been like oh my god I'm not sleeping and and like to like listen we all all traders don't sleep at night at different periods but is there has there ever been a point where you're like holy shit this is this is this is truly and utterly terrifying I think when I was younger Like during the Kuwait war I had I had I was pretty exposed and okay kind of felt like I had like, you know, the poetry of war like war position on you know, you know one from power one from Tom be whatever and yeah, I know again, I was I was young and I was like this this doesn't feel great at all and okay, you had you had the the, the war will get worse. And then when all of a sudden it started to go so

well for the out for the, the, whatever it was called, the coalition of the willing or whatever. I can't even tell you what the trades were, but I can tell you exactly where how I felt. Like that, that I can recall. I have a sense of memory of that very, there was this on the Comex or with this, where were you at the time? Cause I was right of trading upstairs. Okay. The other time that I was legitimately scared, and I think rightfully so, was during, you know, the Troubles in 08, when the geniuses in Congress voted down the first version of the TARP bill. Oh, yeah. Like it was a Thursday afternoon, and everyone thought like, okay, this is going to be okay. And they voted it down. And just, I remember this, the stocks just fucking vacuum, you know, This could be catastrophic. Not so much for my positions, which were actually good. I made a lot of money during the troubles, but I was legitimately afraid for the financial system. Yeah, I had the same one during 9-11, and obviously you probably were being in New York. It was even more frightening for you, but I had a young daughter at the time, and it happened, and I was like, oh my gosh.

I immediately ran to the bank. Like I told my wife, I'm like, put the kid in the car, we're going up north to the cottage. And I ran to the bank and I'm like, I'll take 10,000 CAD and I'll take 10,000 US. And they take me to the side and they go, well, listen, we only have like 6,000 CAD, I mean 6,000 US dollars. And I'm like, shit, somebody beat me to it. And they said, no, sir, you're the only one. And I was like... I was kind of shocked that people weren't more scared about it because like it's easy to say now. But you didn't know at the time there was a lot of stuff happening. And I, yeah. And the other one, again, this was also during the O8. I had a lot of like, I had all like the risk traits. I had like dollar turkey, dollar Brazil. Like I knew, I don't know why I knew that this.

E.M. was gonna get destroyed. And I tried to get out of some dog turkey, and I helped Barclays London. And literally the guy on the other had like a nervous breakdown on the phone. Like literally like, and I finally was like so sympathetic to him, I just said, here, just sell these and just ask somebody to call me back. Just give that, give this to give this org to the offshore trader and have him calling back. And I don't know about that. Like he literally was having a nervous breakdown. And my only guess was he probably had his whole life in Barkley stock. Like, you know, oh yeah.

And he was watching his basically his entire network. And there's so many people like the Lehman guys and like, it must have been just heart wrenching. All right, let's do something a little more not quite as Is this gotta be chapter anything as fast as I can ominous. Um, have you ever talked to yourself out of a great trade? Like has there ever been a trade you're like, oh, and then like, you know, like I have a buddy that tells the story one second. He tells the story about he was, uh, I think I could tell it. I don't think he mind. He was working at Drexel or something and someone just told them that they were going to bring by this really smart guy that was in that was investing in like books. Right. And he's And he said like he had a young family at the time and like 50 it was it was it was 50 grand minimum to be in the series a round of Amazon and he's like I just couldn't enough I just couldn't get 50 grand like it was a lot of money You know I had this young family and he's like told me how much it's worth and It's like a monster number like it's it's absolutely insane. And I gave me, I, you know, I love the guy who does, I can hear it. I can hear the disappointment that he, that he passed on that one. Do you have a story like that? You know, no, thankfully. I mean, probably early in my career, there was like trades I looked at didn't do and I felt back. I think one of the benefits of Getting a little older and having a little more salt than pepper and the hair is that you know, I'm pretty you know Like I live in the world of full accountability in terms of my trading like I think if I passed on it I passed on a lot of good trades, you know, right? Yeah, you're more of a true trader upon which there's a million and stuff like But by the way, your Amazon friend, he probably would have sold it after that. I know. Well, that's what everyone says to me. And you're going to hold it for the next 30 years? Like, I actually knew about Bitcoin. I remember we bought our first Bitcoin at 50 and it was because we were like mining and trading and stuff like that. And everyone says, like, you know, aren't you upset you didn't keep any? I go, there's not a chance I would have like bought Bitcoin.

at 50 and held it to 100,000, like zero chance. So it never even bothers me. Yeah, also like the thing like you alluded to earlier, it's like, I do have like multi decade positions and that have done phenomenal, you know, so like, yeah, capable of that stuff. But it's like, I just don't think about it. Okay. Um, you've been trading for a long time. We talked about the stress and the not sleeping. What, what does that sustained stress done to you in your life?

And does it, is it, is it aged you or do you have any insights about that? Like I would love to hear. I think the really hard part is when you're trading early in your career and you have kids and you have a family and you have all of that compounding at the same time. And I think that is, I think Doing the job and sort of having a life outside of that job is extremely stressful because I just remember what I and plus I commuted to granted separate day to say you did the reverse commute So so I just remember being in a hurry for like 20 years, you know, and that I didn't like very much I will say something and I don't want to get too woo-woo, but I you know I'm a longtime meditator and I think that is if you want to manage risk, I think it's a really important thing to do. I do. And do you think that even like five minutes in the morning is enough? I think anything, it's about consistency over intensity. It doesn't matter. But I would say back to your original question, I think when you're, I think what happens, the stress is like, it does make you short and curt and you become very impatient. And I think that like, you know, to me, it all comes back to being managing your patients with yourself and with the people around you, how to manage this stress. To me, it's, it's all part and parcel. Okay. If you're asking me if I was a dick when I was younger, yes. Well, you know, that's always the funny thing about like, I'm 55. And I always go and look at these guys that get grumpier as they get older. And I'm like, how the hell can you be more of a dick than you were at like 35? I'm always confused about this because I was a complete asshole at 35. And maybe people will say the same thing about 55. And I'll be looking back and go, you know, the 75 year olds will think the 55 was a real dick. Yeah. You know, I was definitely a dick. And also it's like.

Everybody around me did that. So it's sort of like, you don't really have a good role model. What patterns do you think keep repeating that most people refuse to believe will repeat? I think the thing that continues to surprise me and I think that's repeatable is the stuff that's obviously batshit crazy that happens in the market in full and plain style. And no one's post anything bad like for example, I and I've thought about this It's like for your consideration you mentioned Bitcoin and this is not about the utility of Bitcoin not but Bitcoin treasure companies like Who thinks that's a good idea? Like you're gonna borrow a lot of money You're gonna issue a lot of debt to buy something that is inherently a very volatile instrument, you

know, it's like like Between us anyone thinks Michael sailor gets out of this alive. I don't you know I don't know. And again, it's just, and it's not not a shitting on him or Bitcoin. It's just a bad idea. I mean, something else like that. And this is a company I used to own, like that Jack Dorsey can run a publicly held company in a t-shirt on a Polynesian island looking like Hans from Castellet. Who thinks that's going to work out? Because if you look at the stock, hasn't worked very well, you know, okay, for your consideration.

Who thinks it's a good idea for Sam Fried and Giselle Bunshin to be on a panel discussing the financial markets together? I don't think that's a good idea. Like, I don't think she's got a value added, you know. Oh, I can do this all day. But, you know, Mark Zuckerberg decides to spend 80 billion, that's with a B on the metaverse. And now he's like, oh, it's really about the glasses, by the way. I don't know anyone who wears those Google glass. Do you? I don't know the meta glass. Yeah. Like this, this is going on. Like who is in the room with more chicken bird? Like thinks that this is a good idea. Um, this is the kind of stuff that's happening that happens all the time. It's been happening. One of the things that surprises me about markets in terms of what you're just highlighting here is that the adults aren't taking the money away.

And I'll just go back to Elon. And I remember the 420 bid funding secured. Okay. He got high. He was trying to have a threesome with his girlfriend or whatever and thought, oh, wouldn't it be funny to like bid for the company? And I look back at what happened in 2000 and 2001 or two with Tyco and things like that. Like in a regular market, that he would have gotten crucified for that. And the adults would have said, no more funding for you. You're obviously insane. And like now, I know all the Elon fanboys are going to tell me that he's a genius. But yeah, yeah, yeah. But it doesn't matter. In the old days, you wouldn't have gotten, he wouldn't have been able to continue to be funding. And I really think that that set the tone for what's followed.

And one of the things that I'm amazed at is just the flagrant breaking of rules in terms of security laws and how lax we're getting. And to me, this feels like the 1920s. And in the 1920s. It does. And you know, it's funny that you should say the 1920s because I read a great quote recently and it

wasn't about the financial markets, but it was a different context. And it was history is an early warning signal. And that's what it's not like. It's like it took early warning signal. It's reminiscent to you of the 1920s for a reason, because it's telling you that there's something going on here. And I respect that, and I think you're right.

Like even the bucket shops of the 1920s where you got to put down 10% or 5% or 1% and go bet on what stocks were going to do. I see my son and he's out there trading hyperliquids, something on crypto so that he can bet on stocks with this hyperlink. It's exactly the same. The reason that that used to not be allowed was because everyone got fleeced and they made the SEC and had rules and we've all forgotten those. And what I alluded to earlier, it's like, your son should be allowed to do it. That's what he wants to do. But it doesn't mean it ends well. Like, you know, we all have the anecdotal evidence of stuff that happens in the 2000s that is exactly the same right now. Right. You know, okay. So let's get you off the couch and let's start talking about what you see in the markets today. We're kind of already getting there anyways. One of the things that I always, you know, was hugely impressed with you was that fact that you did have a holding period where you could get into these tech stocks, these growth stocks with a story and stay with them. Wow. And you really nailed a lot of them. Are you still long all those? Because like if we go back and look like I am less long, I still own, um, I still own some of those names and, uh, and my kids own more of them than I do at this one. But I think about equity investment is I have a couple of notions about this. The two things you need are money and time. And if you're willing to spend some money and give it time, you have a shot at making money. And then I also think that you have to understand as an investor, this is me talking, where you are in your career, your investment cycle. I'm, again, a person with a little more salt and pepper.

I have my pile and like I like to say is like my job now is to protect the pile. So I have been over the last couple of years sort of creating a couple of years of liquidity for myself. Like if the market every day I look at my profile and I and I stress tested how am I going to feel because down 30% because I think that's a possibility at any given day. So I won't be able to live with that. But I think you just need to understand that. equity

investment is a long-term situation, ideally. And if you're willing to put in the time, there's, you know, Mars just said, like, he was a terrible, he hated equities because as their story is, and he, he was a bomb trader, so he likes mad. Yeah. I, for whatever reason, like a story, and there are a lot of good stories out there. And the general define the right stories and get them levered to the point where you can live with them and sleep well at night and And then how do you sleep well at night with this, the valuations out there? Because any great story to me seems price for perfection and Brown to disappoint. I don't have a lot of pushback about that. But, you know, some of them, well, let's, some of the valuations that are going on right now are just ridiculous. Like that's, I'm not talking about the IPO. So I'm talking about, let's say, some of the Mag7 stocks for which I own a bunch of them. And I've sold a bunch of them as well. They're still very good companies that are going to be around for a long time. And I often said when, you know, I could never get Mars to buy Apple. And he would always show me the articles like, you know, this is, you know, this phone is going to do this to this, you know, and it's all over, you know, don't you know, it's all over. And I would say, you know, as long as the smartest people on the planet are banging on down the doors to work at these companies, they're going to be fine. You know, and that's a good point. But the answer here, I've taken, I'm, you know, my kids are fully invested. I'm not fully invested. In fact, I own on a percentage basis, probably the least amount that I've owned in a long time, ever. On a percentage based. Yeah, I just like there's, there's one thing of liking a company and there's one thing, another thing of liking the stock.

and they're not the same thing. And I just looked at the valuations and whether it be as a percentage of GDP, whether it be a price to sales, there's so many ways that we're so expensive. And like back to Apple, like that's a great example. Back when Warren Buffett was buying it, you could buy it at three times sales because the... He bought it very late, by the way. He bought it very late. Yeah. And but you could buy it there because everyone was worried it was cheap because it was it was going to be tough to grow because it was so large. And yet now here's what is I don't even look lately. But for a while it was over 10 times sales. It was it was in essence at the Scott McNeely price point. One of my questions you have about this about equities and about those those mag seven names. If you go look at profits as a percentage of of GDP or profit margins throughout the years.

It keeps going higher and higher and higher. And to your point, these are really great companies. They keep making more and more money. And that's like the bull's argument. But implicit in that is the belief that profits margins are not mean reverting. And my question to you is, is that the case? And if so, why? And are you is maybe an underappreciated risk that these are quasi oligopolies, maybe the monopolies in some cases that are going to be broken up by the government at some point, just like Bell Telephone was, you know, 30 years, 40 years ago, whatever. I think you're the latter part of your your comment is certainly rational. And but I that if that I that is way in the future. Okay.

anytime. I don't think you don't worry about profits being mean reverting. Like you don't look at these profit margins and and make you make you scared. Like I think Jeremy and Ted thinking I'm not making any assumptions that I know what their future product line is. Because they're future product lines that they're able to continue to have outside margins. Because you would think that having outside margins would attract competition. And yet it hasn't. Right? Like, like, isn't that a fundamental, you know, tenant of capitalism that profits should be mean reverting? Yes. But in terms of the companies that you're talking about, they have managed to sort of stay ahead of that. And they, you know, someone like you talked about Apple, is Apple a technology company or is it a luxury company, a luxury product? It's like, you know, they, you can buy a phone that's not an iPhone.

for a lot cheaper. Yet everybody, not everybody, everybody buys an 11 hundred dollar icon. You know, it's what kind of company is it? And, you know, I don't, you know, I don't know the thing about why I don't get caught up about the profit margins. And I'll quote my, my hero Charlie Munger. It's like, you know, Charlie Munger said, every time I hear it, I just replace it with bullshit. And you know, so, you know, you can, you can get granular about these companies, but the facts are the facts, you know, hating, hating Apple because of profit margins. It's like, you know, it's a tough way to make a living. Yeah, I hear you. Okay, so let's, um, in terms of you've mentioned you've been selling some equities, and let's not talk about what you're doing, because you specifically said your life has changed. But let's think about, you know, Leslie, the macro trader, if you were looking at the

environment today, well, What would you be interested in? What, you know, peaks your interest? And even if you want to talk about like the flattening of the yield curve, you know, whatever, like you look at a lot of things. I'll blend the two with your prior conversation to now. So like what about 18 months ago or whatever it was, I got sort of very constructive on the commodity markets and generally what I do in the metals already have moved. And I forgot what what.

thought processors by storm getting kind of bullshit. Generally, what I would have done is like just buy a bunch of crude calls and buy it, you know, some copper calls and whatever. But at the end of the day, like, I'm a mediocre commodity trader, you know, I know that and I recognize that. But you know what I decided, and I'm still in this trade, it's like, you know, we're good commodity traders, the guys at Noble, the guys at Glencore, the guys at Bali, that got Rio and the guys at Alcoa. And what I did do is I bought a wedge of all those companies and I have them and they've done great and they paid dividend and it solves good in the world and you know and then next just what am I thinking about what am I doing now and I've done something recently when I say recently let's just say um 2026 what is this year's um the next derivative of that trade is like I never really owned international activities and I really ever owned an ETF. But I thought about the commodity story a little bit and I do think that we may be in sort of an early bull cycle for commodities. Could be wrong about that. Please don't aggregate that. So where are the commodities? So I bought the Columbia ETF, I bought the Chile ETF, I bought the Peru ETF, I bought, there's an Africa ETF, which is really South Africa gold miners, whatever. And I bought some of those.

They haven't made any money. Like every one of your pals, I'm in Brazil for two or three years. All right. So that's something different and where I'm putting capital to work as opposed to, you know, that's sort of a different thing for me. And I think that's sort of an interesting way to play that, those markets. Listen, I couldn't agree with you more about Latin. And they're moving to the right. They have the commodity tailwind. a lot of great things about them. And I have to write them up more. The Columbia one is one that I just absolutely love. Did you buy the COLO? COLO. And there's

Peru as well. I have, I think it's, and Chile, Columbia, Peru, Brazil. And actually I bought the Turkey in Israel and, you know, India as well.

So you've got all the emerging markets. One of the things about the buying the emerging markets, though, is that in general, a strong US dollar will be a headwind to that. Are you, when you're thinking about your long-term positions, do you, does the dollar worry you at all? Or are you actually, I don't remember. In a garishly wrong whole year on the dollar. So welcome to the party, pal. Yeah. I kind of feel like a schmuck because it was such the consensus view and not that I'm a contrarian because I think being a contrarian is a tough way to make a living as well. But I was bearish and wrong and I don't know. From where we sit now, I don't know. But that's your trading position. But my bigger question is, do you worry that a US dollar bull market could potentially derail that trade?

Yeah. Okay. Yeah. I mean, I think that's, you know, that's, yeah, I think that's, I won't say obvious, but that is a headwind for sure. What do you think that a US dollar bull market would, where would that come from? Like, what would that look like? The only thing that I think I don't know, but I would tell you that one of the inputs that I think is critical when I look at the currencies is interest rate differentials. And if, in fact, US rates are going higher and I have no idea if they are not, that would be the tailwind for the dollar. But I want to say something about rates because I think this is interesting and informative for me. I look at the 10-year chart every morning. It's like one of the first things I looked at. And I asked myself, again, back to the internal dialogue, I asked myself every day, where's the next 50 basic ones in this chart? And the fact that I changed my mind so often means that I have no fucking idea. Like I really don't know. Like I wish I had a strong view on rates because if I did, I'd be able to do other stuff with confidence, but I don't have to. Well, that's interesting. Um, do you worry about the fact that the yield curve flattened it this recent couple of days? No. No. Okay. Let's go back to the big macro picture. Um, I asked you about commodities. We talked about the dollar. You're not really, uh, don't have a view on rates. Is there anything else from a macro perspective that you would kind of want to highlight? I think there's two things. One is like to borrow from your thing. It's not page 16. It's not page one. It's page eight. Okay. I think this private credit thing is a real thing. And I think the

notion that, well, it's not going to be like away. Well, Oh, so it won't be like the worst thing that happened in the last hundred years means that. I know that's a funny thing. Like everyone compares everything to O8. I'm like, you're never going to get another O8. Like that's not going to happen. You know, you've heard me say, like, don't ask a traitor what he thinks to ask him what his position is. Yeah. And, and Jamie Dimon could say he's not worried about private credit, but he can't get that shit off his books quick enough. You know, so, you know, that concerns me.

And you had one of your guests on recently who was talking about the coyote, you know, the deficits in the coyote being, you know, off the cliff. And I spent the last all my adult life not caring about the deficits and thinking that they didn't matter. I actually think they matter. And I think those chickens are going to come home to roost. And I think that could be a problem. The deficit. So you think that, like, the OVE, the deficit is, as the big short guy says, you think that'll finally, the OVE deficit guys will be right? I think they could be. And I said, I've been ignoring those guys my whole life. Right. So you think that the Steve Eisman, like he probably was at Ojvoi, the deficits. Am I saying that right? By the way, you're going to have to tell me how to actually say that. Good enough. So what would that look like if we did have? I don't know. And I don't know. But I do think that I think there's been an assumption that the US government could sell their treasuries willy-nilly for to anyone and everyone forever, and I'm worried that that may not be the case. And it doesn't have to move a lot for it to become a problem. And the other thing that worries me, again, and this is history, is an early warning signal, is that all these crazy IPOs, I mean, you talk about valuations, I don't know, I don't have a strong opinion about AI one way or another, but...

all these companies are coming to market and I'm not sure which one's Google, which one is Ask Jeeves, which one is Alta Vista. And for your younger members of your audience, you don't know who those companies are, that's exactly the point. And I'm sure somebody makes it, but they're all not gonna make it, not it. I think the market is vastly underestimated how much the supply side has changed in terms of stocks. Like I wrote that piece and I went and looked at the number of shares outstanding for Microsoft and for Google. And it was just, you saw the buybacks, you saw what had

driven this relentless bull market of the past 10, 15, 20 years. And then all of a sudden it's gone sideways. And then Google does the largest.

secondary in history. Right. And these numbers are just massive. Like, I don't think people are really ginormous. Yeah. Like, I, what was the stat the other day that Elon Musk net worth went up in a single day more than Warren Buffett's entire net worth. So he earned a Warren Buffett in a day. Yeah. Yeah. And you know, just to your point about earlier about Elon and about why there are no adults in the room, if you look at the fees that some of these investment banks are getting on these IPOs, you know why there was no adults in the room. And I'm scared because I think that the supply, the demand supplies situation and equity has changed dramatically. And there's going to be a period where like it was already getting sketchy. They were already trying to issue a lot of debt. Now they're finally saying, listen, we've filled the debt markets. Let's now sell equity. And we haven't seen that in years and years and years. Okay. So listen, we've talked about a lot of things. I'm going to hit you up with the, you know, if you were the interviewer and you were asking Leslie Harris and you can go back to the couch, you can talk about the markets. What's the question that I should have asked you that I missed? You know, I think the, I think we I answered it unintentionally when I would say like, what is the commonality of challenges I see among portfolio managers? And I think there is a lot of commonality. And I think we talked about a little bit that it's about not seeing the long lens of their careers. And I think it's about understanding of lack of understanding of patience.

those things are like, they're, you know, it's, it's not that complicated. Like, like you said, you asked me like about two of the 2pm thing that does that turn up turns up all the time. Yeah. And that's not to diminish your pain. I'm telling you, it just took me 35 years to figure it out. That's all. Yeah. And you know, it's just that's just a human condition. You spend enough time talking to people like, you understand, like, you know, even like, when I work with people who are not traders, it's like, Oh, you know, what is the, you know, you're, you're a CEO, like you're a bad delegator. That's, that's why that's why you're miserable. Start delegating. It's like, you know, it's like, it's just a human condition. I'm sorry. It's buzzing. Oh, that's all right. We all understand. Okay, no problem. Okay, now we're going to do the fun

part. So we're going to talk about, you know, I was lucky enough to get, you know, go up for dinner with you and the boys. And we had a terrific time in terms of youths.

telling me about your background and where you grew up and all sorts of great stories. And you're a little older than me. Um, and now that you grew up in the one like in the New York city in an absolutely wild time, right? So, uh, first of all, let's actually talk about that because I remember we had Borg Schlossberg on the show and he grew up, I don't know if he, yeah, I think he grew up in New York and then he went to Columbia. And he says, Oh, you know, but Columbia back then was tough. And he talked about how they went out and they found a rug in the, in the, uh, in the dumpster. And they thought this is great. They're going to use it for wherever their house or for their apartment and things like that. And there was a body in it. And this is like the seventies. So what was like, Tell me about the gritty growing up in the New York City in the 70s. Well, I don't have like, you know, there's this whole nostalgic like, Oh, it was really amazing. It was so gritty. It was dangerous. Like, you know, like, like it was gritty and fun, but it was dangerous. Like I used to say, like, you know, I'd be out and about. I was a teenager. Right. And I lived in Queens, but I was parting always in the city. And so I had to get home and you would like.

really do like an internal dialogue. It's like, okay, what terrible thing could happen to me on the subway, you know, at one o'clock in the morning, like, and you do the litany, like, what are you gonna handle this? And I wish to tell you, I was stoned sober all the time, but I was not. And so what I used to do is like, I would take my money and like put half my money in my sock, half of my back pocket, whatever. So if anyone asked me for money, I would just reach into one pocket. Right. And, you know, it was it was It was dirty and there was a lot of graffiti and it was dangerous. You know, it was like, you know, which wasn't great. I had a tremendous amount of fun and we were out all about. It was like being the biggest amusement park in the world, but it was it was a little dangerous. So one of the things though that you grew up in like the the perfect CBGBs. Yes, period. We were there every Saturday night.

Right. Okay. First of all, I had no idea what that stood for. I had to Google it. Uh, why don't you tell people, because I think most people will be surprised with that country bluegrass, uh, blues and I don't know, whatever. It's something stupid like that has nothing to do with that. It had nothing to do with exactly. It was not punk rock in the list in the least. Uh, tell people about what CBGB's was. what it was like going there, who you saw. Give us the stories because it was it was a club in lower Manhattan. And it was like we're like all the, you know, real the Ramon started there. Patty Smith started there. Television started there. And you'd go there. And it was really dirty. And it was like you know I don't know if they ever mop the floor because you know it was and everyone's smoking which you could smoke inside and you would drink beers and these very loud some of them were really terrible bands would come on and like you just like see like a woman a girl would just like take her top off just she wanted to show the the band what she what they were in for like you know this is what's on the menu should you want this and you know it was fun it was loud and it was great You know, and what was your favorite concert there? There, I think I saw television there, but I got to see the Ramones a lot once they sort of got out of there. Okay. Like I saw television there, but I think once I saw like the Ramones had already started breaking through and they were playing like small theaters. So it was the runaways always opening up for the Ramones, which was really fun. So it was Joan Jett at the runaways is the opening act. And then. Okay.

was the act. But C.V.G. was just like, you knew you were, you knew you were in someplace special, and you knew it was a moment, even I was 17, like, you know, you knew that this was a moment in time that was really appropriate, you know, and special. One of the things you told me I remember at that dinner was you have a rock star that's always like on your list to this day in terms of who you're in love with. Who was she and uh Oh Blondie. Yes. Oh, yeah, I saw Blondie in a club. Oh my gosh Oh, it's like, oh, yeah, I everybody's got a blonde here. I saw her in another bar like I saw her in a bar It's our first out there their first album It was it was on a promotional tour of her first album. We she was playing a bar on Long Island We drove out there. I think one of my friends got arrested. I'm not sure For that it was like for drink like an open nothing but dad like a open It wasn't really that bad. Yeah, everyone's got the blondie, right? Like

everyone has their like minds the go-go's and bull into Carlisle and everyone's got like their one like when they were 17 or whatever it was it was jaw-dropping Okay, uh, let's let's while we're talking music. Let's let's do Desert Island discs, okay? So you got to come up with three different bands or albums that you'll be on the Desert Island and one traitor. Okay. Again, I apologize for dating myself, but I would have to be blood on the tracks, Bob Dylan. Oh, unbelievable. Great album. Great album. Yeah. American Beauty, The Grateful Dead. Yeah, okay. And I'm going to cheat with a double album, Layla, Derek, and the Dominoes. All right. But again, can I bring a single as well? Sure, yeah. Just a 45.

Under pressure, David Bowie, Freddie Mercury and Queen, my favorite single time. Wow, okay. And the trader that you'd bring? Like I said, Charlie Munger, no doubt. Oh, really? Yeah. Charlie Munger, and I would say to your trading audience out there, if you don't have a copy of Poor Charlie's Almanac on your trading desk that you can open up and read 10 pages every day or every other day, do that. You'll love it. And plus, I don't know, I think Charlie Munger once built a boat, so he'd be very useful on the desert island. I think it sank. I think it sank, but he did build, he did, he did build one. Okay, we're gonna have to Google that. Okay, listen, we're gonna end with a speed round. You ready? Okay, so I'm like, I'm knocked out. At least I'm sober. Go ahead. Yeah, that's right. So you grew up in New York City. Yeah. You know, you're older, but you know the city really well.

Greatest neighborhood in New York City to live and then we're gonna do Manhattan only you're not allowed to live in a burb if you're a young person today Like you're 25 working on Wall Street. Where do you live? Today, I mean, I mean, it's changed a bit but Granite village is still one of the great neighborhoods of the world always has been always want to I love I live there as a young guy on Wall Street. It's still a great, great neighborhood. Like I said, one of the great neighborhoods of the world. I didn't realize it's West Village. That's really close, right? West Village, yes. I'm talking about the West Village, yeah. Oh, okay, because that's actually the most expensive place, and I watched this video about all the young people going there, and it seemed like a pretty awesome place to live. Yeah, I think it's gotten a little out of hand, but the West Village is one of the most charming, beautiful neighborhoods in New York City. Best New York City Steakhouse.

For my money it is the strip house on 12th Street. I like that place the best that's The original strip house on 12th Street is my favorite that's if I take And I would say there I've never been to Gallagher's which I'm gonna go to yeah, I think it's supposed to be very good as well I think I've been to that strip of that one on 12th. Okay, best of New York City area. I'm gonna give you area here bagel shop bagel shop Yeah. Um, Oasis Bagels, Utopia Parkway, Queens. Oh, really? And if you're a rap aficionado, it turns up in a bunch of rap music as well. Oh, really? I think Action Jack, Action Johnson talks about it. I think it's turned up in a couple of videos. Yeah. Wow. What was the place you took me to in Brooklyn? Oh, it took it. I took you to Russ and Daughters. Yeah. Okay. Very good smoked fish bagels were average.

Oh, I see. Okay. I did bagels and versus the. Okay. Got it. Um, uh, what do you folks visiting New York city do wrong? What would you suggest they do that they don't? Well, they, I mean, you should not stay anywhere near Times Square or any of the hotels there. Okay. Stay in a small hotel in a neighborhood and not stay in a big hotel anywhere. Got it. Okay. Uh, the, your favorite New York city movie, something based in New York city. Godfather. Nice. All right. Best concert you ever went to? Best concert I ever went to. I've been to a lot. Rolling Stones, Madison Square Garden, Goat's Head Soup Tour, Fourth Row Isle. I like how you know where you sit. Okay, best concert. And you want to know when to hear Crazy? Yeah, always.

Amazing concert I went to and I didn't really care for either of the bands, but I took a girl there Yeah, and she won't go it was a double bill is the Beach Boys in Chicago at Madison Square Garden. Yeah, it was awesome Sure whether the girl that was the girl was awesome too, but the whole it was like one of the great nice Okay, best concert that you missed I would have really liked to have seen the Grateful Dead in Egypt at the pyramids. Oh, I didn't even know they played there. Yeah, I think that was, yeah, I think that would have been something. What year was that? It was probably early 80s, I think. And did you think about going? Was it on your radio? No, I mean, I couldn't get to eat. Yeah. Okay. All right, we got two last ones.

And also, I've been to a lot of memorable Grateful Dead concerts. Two last ones that we're going to end with. Your favorite piece of advice that you've ever given your kids. No, that's a tough one. Well, we have a folkloric piece of advice given from their grandfather, which has been passed on. OK, let's hear it. Never take the cross Bronx Expressway. He told it to my wife. And to me, and we've told that to the kids. And if you if you asked my kids, that would be what they would say. Your best piece will finish with a real sappy when your best piece of advice that you've ever received. It's better to be kind than to be right. That's a really lovely sentiment. Okay, so to learn more about Leslie Harris, where should we send people?

And I help people but thankfully I don't have a website or anything like that. But I am on LinkedIn, Leslie Harris on LinkedIn. You can find me and I talk about what I do and stuff like that. And if you want to send me, if anyone's got a pencil, you can send me an email. It's tribeca18 at gmail.com, T-R-I-B-E-C-A-1-8 at gmail.com. But if you go to LinkedIn, you get an idea of what I'm up to. Okay. And for those that are interested in your executive coaching, just tell people like what What clients are you looking for? Like, I don't want... You know what? Well, I generally work with, like I said, senior leadership people out of the markets. And the folks in the markets, they're generally guys, and they're not all guys, but generally folks who are pretty accomplished and they're trying to get from good to great. Like, they're just like, they're ready. They know what they're doing and they're just trying to get out of their own way.

Well, if you're one of those people that's already good, but want to get to great, go check out Leslie Harris. That's very kind. You know, my job is like, I just try to be useful, you know, and like, that's all, you know, it's not a special sauce. It's just trying to be useful. You were extremely useful in this conversation and not only that, pleasant and charming and just a real treat to have Leslie. Thank you very much for your time. Thank you very much. All right, Patrick. lots of exciting stuff happening in the markets. What's your take? Well, uh, we have to talk about, uh, both the oil market bipolar syndrome that we talked about earlier and, uh, also the war shock syndrome, uh, because both of them, uh, are very appropriate for, uh, what to describe like, I guess, uh, the way I would describe the last week with the peace deal coming in.

uh, is, uh, the pain trade found everybody. Uh, it was, uh, it was, um, there were a lot of crowded thesis out there, uh, and everything unwound and, and found lots of pain for everybody. And so, you know, let's just dive into it and let's dissect what happened. And more importantly, uh, what should we probably expect moving forward? So. We started with the weekend having the It's a called a gap higher on the imminent piss piece deal announced and they signed it. So like the gap was was relatively Warranted on that But you know, obviously we'll get to the oil charts here in just a moment, but the market gaps up towards 52 week highs overall When you have a 5% market correction like we saw spike in volatility We walked to the edge of the cliff. We were virtually on the in the area that most You know big places like Goldman Sachs were saying was the CTA flip zones and the market kind of walked to that edge of the cliff and didn't fall off and basically with this rebound we've basically neutralized the cell cycle and One thing that I want to point out that is just a technical observation is unless this is a broader topping formation which is there's no evidence of that yet. Once one of these five percent market corrections occur often the next month or two is pretty directional now doesn't have to have a huge momentum.

Rarely do you have a second 5% correction that follows within weeks of a first one unless it were in the middle of a bear market and And so the fact that we gapped higher it neutralized the cell cycle and at least at this moment as Set it up in my opinion that the market is going to stay bid throughout the IPO You know issuance cycle Like at this stage, I don't know whether you have information as to the speculation of the dates, but as far as I'm aware, we should see open AI and anthropic come out in the third quarter of the year here. Do you have different information that it is? I don't have different information, but all is right in the world that you and I disagree now again, so we can feel better about that.

I hear what you're saying that after that correction, the typical move is for the S&P to resume its bull trend. I suspect that with all the unlocks, with the IPOs coming, that what will be the surprise will be that we potentially grind lower in the summer as opposed to higher as you imply. No, no. Well, first of all, let me clarify. I think that once the IPOs are coming out, that the grind will reverse in fact that i'm looking for the topping formation of the

next impulse to be happening in that thing i just think the market will generally stay elevated. Into the issuance and then the after effect of the fact that we did this huge cash drain of the issuances will ultimately weigh on the stock market and create the inevitable mean reversion that that's been occurring and so it's okay if we disagree but generally I think that the risk that the market here has a little mini liquidity event or cascade to the downside of some sort, I just think it's being pushed out deeper into the third quarter if not even a fourth quarter story who knows maybe it could be a September October kind of backdrop in the traditional window from which the stock markets tend to.

to struggle at that point. Nonetheless, I think that July will be surprisingly uneventful from a downside market event perspective as my opening stance at this moment. Okay, I'll take the other side of that tree. I think the weakness comes sooner than most people think. And we'll talk about it, but part of the reason is that I suspect that the market needs to readjust to a new Fed that is much more hawkish than. So that's perfect. Great segue. So let's get into this because Warsh took the helm and it's like a new Fed regime, basically. And I'm sure you're actually more attuned to it than I am in terms of being a descriptive, but clearly they're going to communicate less, listen more.

to what the market is asking or needing. And they're going, and they backed off from their dovish positioning. I mean, it was interpreted at least from what I understand as a very distinctly hawkish meeting. What is your kind of takeaway from this Fed meeting? Well, let's divide it up into two different sections. One is Warsh and what he wants to change at the Fed. And then one is just the Fed itself. Let's start with the Fed itself. If we go, I wrote a piece a week or two ago and it was about the fact that if you look at the Taylor rule, the Taylor rule, and although no central bank is tied to the Taylor rule, it gets the underlying direction of which way the bank should lean. Correct. And the Taylor rule is, in essence, the difference between the Fed's target inflation rate and where they are now. And then the employment and what's called the Nehru, which is the national, what is it, natural rate of unemployment. And when you put all those things in there, you'll see that we had a situation where the Taylor rule was declining for the past year, meaning that inflation was coming off, employment was looking

not as good as it used to be. And so it was easy for the Fed to be leaning on the dovish side, even though they hadn't hit their target, their inflation target, right? So the Taylor rule was headed in the correct direction. So in the last three months, it's hooked back up. And I wrote this piece and I still, I believe it's correct. If you're sitting there and you're the Federal Reserve part of the FOMC board, and you're looking at the fact that you haven't hit your target since 2021 in terms of inflation. And not only that, the Taylor rule, the rule upon which you in essence should base your how you set policy is now hooking back up. You have to at the very least err on the side of hawkishness. And so one of the things that I argued was that given the backdrop that you will see the Fed FOMC board members start to lean hawkish. And although the dots are getting downplayed in their importance, if you look at the dots, they shifted dramatically higher, meaning that the FOMC board itself has shifted more to the hawkish side. Now let's talk about Warsh. Warsh came out and, yes, he did let the dots and the statements speak for itself. He ducked everything in terms of questions about future policy and where we're headed. But what he emphasized was telling. Let's remember that the Federal Reserve has a dual mandate.

One is to have maximum and full employment. And the other is price stability. He just kept hammering that price stability over and over and over again. And so I kind of made a clip. I just grabbed all the times he said price stability and it was five minutes long in terms of how many times he said it. And he just kind of as an offside, I mean, as an offshoot, just once or twice mentioned employment, but it was by no means the actual emphasis of his talk. The emphasis was all about price stability. Now, from here, you could argue that they're actually not going to tighten, that this is just hawkish talk, as you'd expect. And I would say, great, okay, we can debate whether they're going to tighten or not.

But that still doesn't help you if you were sitting there expecting a Federal Reserve chair that was going to go and do Trump's bidding. Because in the meantime, and let's get to the charts, pull up December so far, we have to go to a lower low like I was and see. So, so to me, you know, from here we can debate where they're headed and actually how hawkish they are. But this was the move I was looking for in terms of at least the curve is getting towards a more normal curve in that there is some chance of a hike priced

in and those I'll just I'll just point out here like and just to kind of support your thing based on the CME that funds futures right now they're baking in for the July meeting.

a one in three chance, 36% that they're already going to hike the next meeting. Yeah. Uh, and now you one second, I said, but in Patrick, before the before the FOMC meeting, that was 10%. No, like it was really low. Yeah, it was almost a outlier and and you observe here now going to the end of the year what you can see with that December sofa you just talked about as a kind of benchmark for this but we're trading at 410 on that sofa and here you can see that they're baking in even a one in three chance that there's going to be a second rate hike this year. And like that literally right now, they're basically pricing only a 13% chance that the Fed doesn't hike this year. Yeah, like it they're baking this in. So this hawkish tight Fed is there. But you know, the one thing I wanted to speak to here, Kev, is is that To me what was interesting was that we sort of saw this language from almost all of the central banks around the world and the Fed I think was the last one to kind of more explicitly join this tightening.

um regime kind of uh period right like uh and I guess that's because uh other central banks around the world don't have a dual mandate like the US does and so everyone was hanging on these jobs numbers in the US but what it seems to me very clear this is like all of these central banks have suddenly all aligned and they're all very clearly leaning hawkish And we already saw the rate hikes come in in Bank of Japan and in ECB. And and now we have a legitimate chance that we're going to see a July hike. And even if we don't get a July hike, the the moves in the market are affect financial conditions. Oh, this is my point is that we can sit around and argue whether they're going to actually hike or not. It doesn't matter. It doesn't matter. The market is now tightened.

for the Fed. Basically, right now, if you go and try and borrow that money, you're already paying the higher rate, implicit rate hike being baked in, right? Like, I could make the case and that they're not actually going to hike. And I'm not even against that. But my point was, like a week or two ago, that we're going to see more hawkishness out of this Fed and that the curve will reprice. From there, we can debate whether they're actually going

to hike or not. But that that implicit repricing of the curve has occurred. So, you know, it's funny that you even said that because one of the things that I really wanted to do in this episode was to make a bet with you as to, you know, whether or not there's going to be a substantial pivot in the fed language by September.

Like, I basically think that this entire global central bank hawkishness that has been there, I think that there's going to be a spectacular pivot this year. Well, pivot away from the hawkish. I don't know about like to be outright dovish, we would need to see something economically and financially deteriorate significantly and deteriorating in a couple months over the summer is just not a realistic timeframe from a macro perspective for that to occur. But I think that especially the this all these traders that are Or the bond traders and so on that are hinged on these higher inflation numbers kind of having the stirred traders price in all these this inflation fighting reality is you know month over month oils declining and even if oil does rise in the month to come the reality is that oil Inflation is measured and month over month changes and when it's a supply shock driven inflation then it's going to be kind of neutralized in the month over month numbers over time.

And the reality is that all of this kind of spike in the year over year and month over month inflation numbers that we saw is going to normalize. And whether it goes to their 2% target or something like this is I don't know, but it's certainly no longer going to be the story as we go into a few months. And so why would they need to maintain such a tight hawkish market when uh because it's not monetary inflation that's driving this this is this is the the supply side food and and energy inflation that's been driving this okay tear apart my argument i'm not going to tear apart because if you looked at my piece that i wrote about the fed moving to start reading your stuff yeah you should actually i do actually um the uh but if you looked at it i spoke about the fact that the tailor rules moving up but when you look because backward-looking indicators were all showing strength and there would have to be an implicit tightening from those backward-looking indicators. The trouble was that if you looked at the forward-looking indicators or if you looked at the strength of the labor market, both of those were weak. So let's just take inflation. One-year inflation swaps in the

middle of May were trading at 3.5%. One-year inflation swaps, 3.5%. Today, 245.

That is a monster move lower in implied inflation. So to your point, the market is already looking at that and saying, oh, look at this. We are not going to have as much inflation as we thought it's going to go down. And so that's the implied. And then in terms of the employment numbers, everyone was, you know, Rarying the the strong employment numbers of the past three months, but if you look at them, they're absolutely crap. It's all It's all healthcare mostly for the last 12 months and in terms of this previous this last month It was all FIFA World Cup leisure and hospitality in government This is not a labor market that is strong So one of the things that I had trouble with Patrick was I thought the Fed was gonna be more hawkish That's coming to be. But that hawkishness is probably not warranted because I'm with you. The economy is not as strong as everyone thinks. But unfortunately, when you've missed your inflation target for so long and you have those things hooking up, you just have to err on that side. Even if you don't end up tightening, you have to show that you're not just asleep at the switch and you're not ignoring it. So here's my call, Kev. At some point this summer, loading up on sofas and bonds, whether even a mid to longer term duration, is going to be a moneymaker. I feel like fading this this move. Now again, I don't feel like today is necessarily the timing like you don't go the day or two after the meeting and already fade it. But I actually think that this this shoot whichever way we go, I feel there's an amazing opportunity to fade this. It's just about waiting for the first to kind of fully get priced into its max and then fade it the other way. I'm going to push back and say that I think that you actually can buy 30s now.

And one of the things that was interesting about this move, Patrick, in terms of into the Fed's hawkish FOMC press conference is that everyone forgets or is just kind of, they don't forget some people don't believe this. But the worst thing for a long bond investor is an overly loose Fed. What they are telling you is that they will tolerate inflation and that the value of your asset, which is in essence money, will be devalued through that inflation. And so an overly hawkish Fed or a properly hawkish Fed, because I think that the market had priced in an overly hawkish Fed, I mean, dovish Fed, they had assumed that Worch was going to do Trump's bidding and lower

rates. And by the way, Patrick, we haven't talked about this. But one of the interesting points about this recent move in terms of being hawkish, if you look at what Trump said, Right after the meeting he he said I don't really like it, but he might even have to raise rates He didn't start talking about his golf game. He just started insulting him He I believe that Warsh and Besson have talked him in to understanding that the Fed needs to be independent and that the Fed might need to raise rates and He's gonna let the Fed do what it what it wants and listen It's Trump. He'll eventually be mad. He'll eventually be yelling at, at, at Warsh like he yells at everybody. So it's not going to, you know, Warsh's fate won't be any different, but don't forget Warsh is there for seven years, seven years. He's going to be there longer with the next president than he is with this president. Yeah. Right. And so back to the bond market, Patrick, what happened with the 30 year? It actually rallied.

on the hawkish first. So this is the this is the 30 year monthly chart. And the reason I want to start with monthly and then we narrow down is for this. This is a where roughly that 5% yield level is on. This is obviously the bond versus the the the yield chart. But this is roughly and there was so many traders bogeymaning You know that end of the world if 5% is is beat in a big way like there was going to be a huge bond move, but this is a major You know for this decade a major support line Yeah, the 5% yield and and it so far has held and so when we get down here You're absolutely right that unlike the shorter end of the curve the long bond has actually for the first time actually closed above its 50 day moving average since February. Yeah, they like a hawkish Fed bond markets like a hawkish Fed. Yeah, don't ever forget that. Yeah. And so nonetheless, bonds definitely are moving a little bit. But the other thing, though, that I wanted to to then pivot to is the single most important chart to watch the dollar. So But actually it's quite significant that it was the FOMC catalyst or the news of the event that actually spurred a breakout out of a one-year trade range. And like if it was just a technical short-term move, it could be easily a prairie dog.

or a fake-out move there. But the fact that this 100 to 97 level more or less contained the vast majority of the price action of the last 15 months. And while we've several times tried to beat the 100 level, each time it failed, and immediately retraced right back into the trade range. Now, we had this two-

day breakout that is actually to a 15-month new high, a 52-week new high, we can call it. And it's going to be very curious whether or not we're going to see that this hawkishness. Well, I look at it, All this other central banks, everyone knew that they were hawkish and they were going to raise. But the fact that there was that much more of a hawkish tone from the Fed, there's clearly some recalibration in the rate differentials and other things like this that.

have certainly given the US dollar a bull tailwind, but the US dollar is also the funding currency and therefore there could be concerns about funding stresses and other things from such tight central banks, whatever it is, the dollar is breaking out and I don't want to ignore it. And what's particularly interesting about is when you go by cross currency, the reason I'm not overly concerned yet is that the euro has not decisively broken down yet the support line so the dollar index is sort of doing it because of a couple of the other crosses but the year but if the euro breaks this 114 level. Then we have the backdrop from which a dollar could rally, but then you take the pound sterling coming back to March lows, ready to break down. You have the Canadian dollar, I shall put it as the US CAD. Look at this breakout.

on the US dollar against the Canadian dollar like this is insane like this from from trough to peak was a 600 pip rip on a six cent rip on the upside of the US CAD and more importantly it cut it's cutting through this previous high like it didn't wasn't even there. And, and then, and then there's this one that I don't know why anyone would do this, but then there's the yen. But like, I wouldn't know who would be long the yen, because God, whatever that is, that guy's an idiot. Exactly. Like, complete idiot. No, but all joking aside. But the one thing was, was like, this was the level where the Japanese central bank and government were adamantly trying to defend the line and hold the currency stable. And a broad US dollar rally was just so big that basically they didn't even bother to try to intervene here. Yeah, I'm with you Patrick. Listen, I'm not going to disagree. Someone asked me about my view on the dollar the other day and I said, well, You know, I have a bias I think that the US dollars headed down over the longer term But at this point it's tough to stand in the way and my point is I'm just flat because I could see The conditions being in place for a huge rally when the only thing I will say I'm not flat against the end and I do believe that if we

got If we got a continued rally in the dollar, I suspect that will eventually create an risk-off situation And then the risk off situation, if we got stocks to correct in a meaningful matter, I'm not sure the yen doesn't rally. So to me, the ultimate, this eventually causes risk off, which eventually causes the yen to lead out of this. So I'm sticking with my yen. I'll let you know when I puke so that you can get along because that'll be the point where you should really load up.

The one thing that I'm trying to reconcile or try to think through in terms of, okay, well, first of all, we don't know 100% that a US dollar bull market has just started. We're just early speculation, technically it's showing accumulation that are characteristic of the beginning of a bull trend. So there are signs. Now, there are two types of US dollar moves, one that are caused in a period of stress. that is driven by, let's say, risk-off dynamics and types of elements. And then there are more meaningful trends that are established because of just the dollar regime cycle that we're in and some bigger moves. And as an example, you can compare the 2022 move versus the 2024 move. Now if my early idea here is this, we could get a move that is similar to 2024 over here. If we find that by September, the Federal Reserve is already backtracking its hawkishness, going far more to a neutral positioning. I won't say dovish. So one of the things though, can I just interrupt there? Because everyone's talking about this in terms of what the Fed's going to do. The Fed's not going to tell you anymore. No.

Like, and, and so be careful when you're sitting there and you're saying to yourself, oh, um, you know, maybe the federal backtrack, the fed's not going to give you signals. So it'll actually be the data that'll be affecting it. Yeah. And not only that, Patrick, I'm not sure that they're going to be like before when the, when the market had fully priced in a rate, a rate hike or rate cut, mostly rate hikes. They made sure that they, they leaked stuff to the markets beforehand. I'm not sure that we won't see a situation where the market thinks there's a one in three chance that they hike and they actually hike. So be careful with that language that the Fed is going to guide. I think that the days of the Fed guiding are over. Well, I mean, we'll see it obviously the way stir traders price it in, right? Like in the end. I'm just highlighting this because I hear lots of people saying this and I don't think that you're going to get those Hence anymore, the market is going to be left

making their own decisions, their own conclusions about what the Fed's going to do based upon the data. And the Fed's not going to give you those sorts of clues that they did in the past. Right. So nonetheless, it'll be very interesting to see whether this holds. Because it came on such a distinctly, a distinct thing like a Fed a new regime kind of change in the way that they're positioned. I think this dollar breakout has merit to actually stick. But what I'm waiting for the validation is the Euro breakdown below 114. Because like if the Euro holds the line at 114, then this isn't a real breakout. And I want that confirmation here as we move forward. The Europeans are doing their best. William Wallace.

Okay, what's the next one? So, okay, let's let's circle back. Actually, no, let's talk oil and then we'll circle back to the stock market. Okay. Well, are we going to talk precious metals? Because I would like to talk precious metals. Well, and it makes sense given that we just talked to dollar. Okay. And before we continue, I just want to I want to ask you something and I hope you remember. But last market huddle, I spoke about consumer sentiment, or sorry, not consumer sentiment, gold sentiment being zero. And I saw this chart and I was completely and utterly taken aback in that I made a mistake. I didn't understand what this chart was. Uh, you, you had kindly explained to me that it's not what I thought it was. I, I mistakenly believed it was a survey about, about people that trade gold in terms of you're talking about the bullish percentage index. Yes. That is. And they went around because I, I cited this thing about zero percent.

gold bulls. And I thought that this was a sentiment indicator, just like the AII. And you were kind enough to explain to me that I was wrong. And I thought it would be really important because I suspect that if, you know, other people might have made the same mistake. Now, I suspect our listeners are way smarter than that. And they're not as dumb as me. But for those who might not be up to speed on the technical, you know, stuff in terms of what this means. Why don't you explain to people what that is and explain why was your partner was completely not really mistaken. Okay, so so first of all, what I wanted to describe is like, for instance, let's take something like the this breath indicator, which is like looking at how many stocks are above their 50 day moving averages, right? It's just simply measuring or gauging.

There's 500 stocks. How many of them are above or below their moving average? Now, of course, when you get to a stage where it's at 0 or 5% or 10%, it's certainly reflective of the fact that some sort of dramatic flows are coming in the markets and driving the fact that the majority of stocks are declining. And therefore, some people can say that's an oversold condition enough to warrant buying. But the bullish percentage index that stock charts produces, that everyone was throwing around at the zero level, uses a very similar technique by using point and figure charting. Point and figure charting is the old school way of X's and O's, where it's not measuring time, but rather price on the chart to create a new sequence of...

up and down chart sequences on the graph paper. That's literally when people were using it back in the days of graph paper. But the point, though, is that it gives a buy or a sell signal simply by one row of Xs or one row of O's in the case of a downtrend, breaking to a lower low than its previous set of O's. So all you need is a lower low than in this previous sequence for it to be classified as a downtrend. And all the bullish percentage index is asking is how many of the stocks, so let's say in the gold miners bullish percentage index, let's say they have 30 miners in the basket. They're just asking how many of those 30 miners are giving a bull signal versus giving a bear signal?

because it can only be one or the other. It's a bull signal until the bear signal gives. And so just because the whole sector was moving together and all of the lows made a lower low, the bullish percentage index had zero. But that in itself may not mean that we have extreme sentiment or that we have seen a washout. in the trend moves. It just means they made a lower low. And when sequences are making lower lows, that may just be the midst of a bear market. So what happens a lot of times on those types of charts is that they'll go and re-visit, they'll pop and re-visit the low and re-visit the low and spend two or even three months along those lows as the downtrend is engaged in a sequence of selling.

I would not use it exactly that way as a sentiment tool, while implying that everyone is so bearish that it must be bullish. It's just a pure observation of a technical sequence of our stocks making lower lows and lower highs type of measurement. Well, that's great. Thank you for explaining that because I

was completely and utterly wrong about that. And the language when they describe it, really led me to believe that it was more of a, of a survey as opposed to just technical. It's just a, when, when you love gold, you're looking for any reason to, uh, to, no, but I mean, listen, that's the nature. I didn't realize that there was any, that that, that that was a technical indicator in essence about breadth and, and, and who knew that they were going to be using point and figure charts or whatever. But.

I just now I know to watch for those things and they don't mean what I think. And so thank you very much for explaining that Patrick. No worries, buddy. So but let's let's talk gold though. And this remains an ugly chart. And it's very actively distributed. And I was speculating on the idea that we had that reversal on the peace deal that whether or not that was sufficient to have held the line on gold. And that could have been like a key support line on there. But the one thing I was talking about with my big picture trading members was simply that we would need to see a reclaim of the kind of 45 to 4600 area like we would need to see a beat above the 50 day moving average beat above a Fibonacci zone things that indicate that the prevailing step ladder or step staircase down of lower highs and lower lows has been reversed and as of this moment this rally classifies actually in the weaker side of the category like this little bounce in gold is borderline pathetic on a relative basis to other bounces. And the fact that in the post-war period, sold right back to their lows, I have to be concerned. And I say this carefully because I want to stress to our listeners that I'm a super huge gold bug.

And I have been I made a ridiculous amount of money on golden and have over the last decade had gold as a part of my portfolio persistently so this is not some I don't say this lightly when when I'm sitting on gold here on the technicals this still is a distributive chart and the fact that this hawkish. um tone from uh from wash came out uh there's we may have a very difficult summer for gold that's what i like about you patrick you're not afraid to go against your uh prevailing bias and say call the chart like it looks like to you and uh it's very important because you know what though and what I try to teach my members is that you don't have to bend in your gold position but because we so actively use options the key is that when the chart looks this bad you can't be delta one you have to have an option overlay something to

dampen downside volatility give yourself the tactical ability to improve your position and key.

you know averaging down areas and things like this. I don't like to suggest that we're short selling or that you should be completely out but you have to acknowledge that there are cycles in the market and when gold is in a down cycle your job is not to be an ostrich and put your head in the sand. Your job is to observe what's happening and protect your portfolios appropriately. The point here though is that when we put this on a weekly chart And we observed that the blow off top that happened in that parabolic rise even just a 50% retracement of the two-year bull market is 3600 now I'm not sending that has to be the number we hit just a context of you know often after major rallies giving back half of the prior gains is something asset prices around on in every market have demonstrated so you know is there still room for through you know three four five hundred dollars on the downside in a challenging summer I would if it happens I'll be buying but but there's definitely now there is very little at this moment thing a rising US dollar and higher rates in a least of next few months, this is not a tailwind for gold. It's a headwind. Yeah, no, you're absolutely correct, Patrick. The only thing to kind of push back against that is that that dual regression analysis in terms of US dollar and the real rates affecting gold got thrown out the window. And we rallied in one of the largest periods in terms of rising rates and rising US dollar that we've seen in ages. And so the real question is, are we in an environment where that old relationship of rates and US dollar drags it down? Or will the other, what I think is a longer term new trend of central bank buying push it up?

You know what? But Kev, I keep it simple. The tape will show that. I'm not disagreeing with you right now. It's very clear which one. If we're entering a period of new accumulation in gold, you'll see it on the tape. And right now, this is a very ugly tape. Uh, and, uh, and it's not showing reversal signs. So you have to trade accordingly. All right. So if you have an ugly tape, let's go to, uh, oil. Oh my God. Like, uh, I won't lie. Uh, I took a, uh, uh, probably my biggest drawdown, uh, in years from I have a buddy, I have a buddy that was talking about this and he was saying he was shocked at the number of smart people that have gone and heard on this. Yeah. And.

You know, like obviously I spent a lot of time kind of stepping back and trying to, uh, to, you know, like why would it wouldn't have carried stronger hedges around this thing, take advantage of the right tail, skew, all of the stuff in hindsight. But bottom line is, is that, uh, I, well, anyway, bottom line is there came a peace deal that, uh, that a lot of people were skeptical was going to come through, especially since, uh, Trump has cried wolf so many times. that it was very hard to say this time it's real like when you know what after it's 39th time saying that you know the peace deal is coming tomorrow you know it's it was very hard to take them seriously like this time it was different and it was and then and certainly caused a repricing but the part that I find fascinating is is is that now how do you now reconcile how much of this was driven by the pain trade, the fact that a very large amount of smart people were crowded into the reality of what everyone knew. They knew, and even Trump admitted it on the G7 speech, that we were four weeks away from serious inventory stresses on oil around the world. Hence why we probably took a bad deal to avoid that circumstance. But everyone that was smart knew the reality that we were four weeks away. And so everyone was positioning for what was supposedly the asymmetry of the trade, which is, you know, there's probably limited downside and there's a huge upside if it happened. But the margin calls, CTA flips, dealer, you know, the Vanna tailwind of ball collapsing and the right tail collapsing on oil, basically that probably had huge delta hedge unwind, all these different effects basically washing out oil in what was a spectacular cascade to the downside. I don't know whether we can want to call it a crash to the downside, but definitely a liquidity cascade. But the question in my mind is what is now the fair value of oil? You know, I love the way art Berman described it saying like, imagine this was a human body.

the system experienced a 20% blood loss. Basically the inventories around the world were depleted and what this peace deal did was stitch the wound. Right now the blood loss is no longer a thing, but the system still is 20% less in blood. And there's going to be a structural demand for oil in the replenishment cycle. And it's still going to take months for the straight to even normalize. So we don't have a situation where realistically oil should be trading in the 60 to 70 area without it being driven there by simply traders being offside and being forced to cover, which is what we

witnessed. So the part I'm curious about is where after all the forced flows settle, Where is the normalization level of oil going to come in? I'd like to fantasize it's in the 80 to 90 dollar range, but do you have any speculation as to where you think it should settle? I don't want to give you a hard time of not reading my pieces because I know I did write a lot this week, but I bought it this week in terms of into this bush lower.

My whole argument is that the SPRs were way more effective than anyone. I did read this piece, by the way. You say that, I don't believe you. No, I didn't read your other ones, but I read this one. The SPRs were way more effective than anyone realizes or sorry, than the bulls, the barrel counters realized. They neutralized the supply. got the supply emptiness. They created enough supply so that the bank bottoms weren't going to be approaching anytime soon. And in the process, we had the speculators, as you mentioned, get stopped out and sold. But I look at this, now we have this situation where supposedly everything is is solved. And we're going to be back to normal. And let's just assume that that's correct. Let's take Trump at his word, and that we're going to return to the old, the old straight-to-heart moves is going to be going all, everyone's back online. To me, we've just had months and months and months of them just emptying the SPRs as fast as they can. And on the other side of this, they're going to have to replenish them.

And not only that, what has this war taught every single country out there? It's taught them that the importance of an SPR. So not only are we going to get a replenishment of the SPRs, I think the SPRs are going to grow in their size. And I look at the SPR in the US and Biden, I think foolishly sold it down. And we're at absolute lows. We're at the level of oil. that in terms of an SPR that we were in 1985, the economy is way, way bigger than 1985. And yes, I understand that the US is no longer an importer of oil like they used to be. Having said that, in this day and age of increasing geopolitical tensions, it seems to me that it's foolishness at its highest order to not have a massive SPR.

The other thing is that I know that China is very much more electric focused than the rest of the world. So some people say, oh, it doesn't matter as much. But I still think that the part of the reason that this was so that the

boom, the squeeze never came was because China had thought this through so well. They had such a large SPR. And although I understand that they are increasingly trying to go more and more electric, I still look at this from China's perspective and say, holy shit, you know, the US is more volatile than we ever imagined. You know, between Venezuela and this, we need to have an even bigger SPR because at the end of the day, Patrick, your aircraft carriers, they don't run on batteries. Okay, I subscribe to this. And you know, a good friend of ours show and Louis Vincent Gav.

had that very thesis basically that, that, you know, the next few years to come, there's going to be a structural demand, but not just for oil, but for basically ensuring that strategic reserves of almost all commodities 100% is going to is going to become a theme. And I subscribe to that. So listen, you can talk that story. I love it. And I agree with it 100%. But what I'm trying to sort out with oil here is, and first of all, do you agree that this was just for selling that basically was, too many traders were caught offside and being forced out? This last week? Yeah. 100%. Right. The stopovers out there are huge. The amount of people that were just tossing in the towel and selling I was actually surprised. I thought more of them had given up. I didn't expect them to be as many longs in the market as there were, right? And so I don't know anyone that was buying into that dip. Everyone I know was long and sell. I did. Well, I bought it as well, but I hadn't been.

actively as bullish as some in terms of before, I just looked at the pain around that I saw in all the oil bulls. And I thought to myself, this is it. This is, this is unfortunately markets are hard. Trading is hard. And that's what I wrote. And I love Mark Fisher, uh, that NYMEX trader. And if he's ever listening, I would love to have him on the show because he's just one of my idols. But he always says what's obvious, you know, sorry, if it's obvious, it's obviously wrong. And to me, you know, it seemed obvious, you know, three months ago that oil was headed to 200 because we're going to get to tank bottoms. And what happened? It was obvious it was headed higher. It went lower. And to me now, in the midst of Trump telling you, oh, oil is headed lower. Everyone is all the, all the oil bears are doing victory laps. It's just absolutely brutal on Twitter how miserable they are to the oil bulls. But anyway, still be it. Um, and to me, it's obvious now is headed lower and.

Well, that's why I'm looking. You know, there is one very important indicator that that is supportive of all this. Jim Kramer came out and said that next month we were going to see oil under 70. There you go. So like this, this, this, we've got ourselves a core technical signal that the but but if but it would What I'm going to try corner out at you, though, is what's your best guess that not where a short-term price level is attained, but what is the kind of, if we averaged the price of oils, all of its volumes traded throughout the summer, where do you think is going to be sort of like the fair value area of oil in this postwar regime?

Uh, I think it grinds higher back into the middle of that range that I'm looking at this chart. So what is that? So I'm sorry. Okay. Middle of the range is a little different because middle of range is a hundred, like, uh, almost a hundred, right? Like 95, uh, 96 is, um, I think we had there there. You think so. I, I, I, uh, I'm, I'm trying to be, I'm planning, uh, that, uh, to like, if I would be grateful if it got back to 95. Yeah. But I feel that I'm trying to plan my trading plan around it only being back to like 85. Okay, the way I mean, like you want to create a realistic way of of not over creating too high expectations on on this because like I mean, I feel like we were during the war, we were trading at 100 for us to go back there post war seems. Yeah, listen, I'm not as much trading the physical oil like the futures as much as the stock. Thank you. So now let's talk about stocks because the energy stocks started to sell obviously, some harder than others. Like obviously some of the bigger hit ones were suddenly this reversal in the oil service names, like the Schlumberger's and Halliburton's puked a whole bunch in the last few days. Obviously just broader selling as we see breakdowns in you know, the exploration and production, energy names and so on. But the one thing I wanted to ask you about, because again, I read your piece. So and I know exactly. We believe you Patrick. We believe you. No, no, but I understand the argument that that, you know, over the even the next three, five years, these energy companies are going to be well positioned because generally the views towards energy are going to be very different in this post-war regime than they were during the ESG phases the decade prior. And so there's going to be a bull tailwind to energy stocks, which I subscribe to a lot of the things you said. But the one part that I'm trying to reconcile is this. In the last, the first six months of this year, you can define uh, the two sectors, you know, I think like Charlie McElligan

called it like his barbell thing, but the two sectors that if you own them was all the returns. You if you own 50%, semiconductor 50% energy, you basically had a perfect portfolio, uh, for the first half of the year and anything else fucking didn't perform at all. Like it was just, it was, it was brutal. Now in the, uh, has this post war regime change?

change the perspective of balancing a portfolio moving forward and will we see a period where now that these are not in an uptrend that many portfolio managers are rebalancing the sector distribution and and there isn't big wave of new money coming back into energy stocks on the short term. Because on the long term, I agree with you. What I'm concerned is, is that a sector rebalancing in this post war regime can have a distribution on these energy stocks be the story of the summer. And, and even though you'll be right on the longer term, what do you what's your pushback? So my pushback to that is I think that's already happened. that we have everyone has sold it, that there's very few people that are trading this from the long side. In fact, I wouldn't be surprised if you went, like I should go look at the prime brokerage data, but I'll bet you anything. If you look at a sector basis that the fast money guys like the pod shops and the hedge funds, they're long gone. There's no way that they're holding into this sort of thing. And in fact, it wouldn't surprise me at all if they're using this as a funding trade to buy the other things, right? And so to me, one of the things that I'm more worried about when I'm thinking about my energy lungs is that I'm very concerned about the market as a whole. So one of the things that I could envision happening is that we have a situation where economy rolls over or they're viewed or they're worried about higher rates or they're viewed about liquidity squeeze from a higher dollar. We get a risk off event.

And these things end up going nowhere because the reality is that the market's struggling. So one of the things that I just wanted to highlight is that I like energy stocks, but I like them on a relative basis all the more. Okay. So my position is that I, my position is, is that generally I love the energy stock story. And, and equally, I love the gold miner story. I just don't think they're going to be the trade of the summer. I think that you have to have a much longer time horizon and you have to be able to buffer some short-term volatility still in order to endure the other side. Of course, these kind of dips are the buy-on dips. And by the way, I want to show you, go to

this OIH for a moment. I want to put it on a monthly chart. I just want to step out and really observe just that this breakout, yes, it was a very strong one, but we are literally seeing a multi-decade bear market.

just starting to turn and what I wanted to highlight was that like it it would be a Normal you know on a monthly chart basis for us to have a pullback before it resumes and that pullback could be several more months and it could be you know to what were let's say previous highs to act as support point is While I do believe that there's a major bull market that is going to be decades long. On the same time, you know, if we went and saw still another 10 to 15% decline in the oil, OIH heading down to summer down to 320 or something, it wouldn't be a surprise to me. And so again, what I'm saying is like, I love the story. I'm not even going to push back on anything you're saying.

I just still see a chart that just started to break down. And there's going to, I think, still be a period of even months where these energy stocks need to think. What could change that? 100 oil could. So I'm going to push back and say, Patrick, one of the things is that we've gone from 16 PE and I know that you shouldn't trade energy stocks necessarily on PEs, but we've gone to a 16 PE on XLE, rallied up to a 20. Now we're back down to a 12. And the market's got a lot of pessimism in there. We have a situation where earnings just hang in there and don't roll over. People are going to start looking around and saying these stocks are cheap. And so you're right. I don't know if that's going to come this summer. I just know that the surprise I suspect will be to the upside, not to the downside. And by the way, I'm super bullish, the energy stocks for the next two, three years. This is that we're talking the tactical ebb and flow movement of flows that, you know, may create these short term, you know, one or two month trends and we're debating like where is the next tactical buy opportunity.

Right. But like I am structurally bullish these energy stocks. So let's just see. Well, we'll call it here on the show when we talk about these all the time. So I'm sure we're in the weeks to come. We'll do reconcile these different things. I want to briefly go and circle back to the S&P because I don't want to keep going too much longer, but I wanted to just touch on a couple of things. I was speculating that we could have seen a blow off top

in semiconductors. And this is clearly false. Any thesis about a short-term top coming in and the parabolic blow-off is not there. And I find it fascinating because after that ridiculous movement until that ridiculous move in AMD and all of these crazy moves that had all the telltale signs of bubble blow-offs, kind of like parabolic rises, and they bought the freaking dip.

like it's it's insane and and even you know they were there was all sorts of headlines in the South Korean markets where basically they're cutting off loans because people are taking out loans at the banks just to fund them into the markets and and so that they're tightening credit to kind of cool off the South Korean speculator and the thing still rips to a fresh new 52-week high. This bubble is still going and this goes back to my thesis that I said at the very beginning and I want to circle back to it is that I feel that during this IPO funding cycle there's a lot natural reasons why the market can stay buoyant and frothy through the actual IPO cycle and only when all the froth and all the money has been sucked out of the system that all the adage of when the ducks quack you feed them or right now the ducks are being fed very well and And and the thing though is no matter how stupid we think it is and we know how this the story ends every single time the thing is the timing of it is Just because we know that to be true doesn't mean that the next two months going into August can't have this kind of Froth or at least the buoyancy of this story to remain elevated as the AI uh, uh, boom, kind of an excitement around anthropic and open AI and all this stuff really gets working. And this all just really ends badly. Um, uh, on the other side, like, what's your pushback? I have no pushback. I, and I agree. Listen, if you go back and you look at 1998, I think we rallied in the NASDAQ, it was 60% or something in 98 or 99. And then we doubled again in the, in the last push, right? You can go from overbought to massively overbought. But I just want to remind folks that if you go look at the NASDAQ and you look at from the 2000 high to the 2001 low, the decline was 72%. So back to your point is we know how it ends. So yeah, and I want to just show one chart. Hold on.

This this is a chart and just have it on my whatsapp here, but this is just showing the performance of every IPO that As they basically get went out what you can see like one week one month like what you basically had was

that even three months after the IPOs 57% of the more positive but going the one year max drawdown on every single one of them was at least 50% red. We'll save this for another debate for another time because we are running late, but one of the things that's much different about this IPO cycle is that it's the size. The size is completely and utterly in another league. I'm curious what it would be if we divided it by a GDP to normalize the dollar size to Oh, this is huge. Listen, it's huge. We're going to look back, Patrick. And we're just going to be like Elon Musk went up in net worth by an entire Warren Buffett in one day. So Warren Buffett has spent his whole life investing smartly, shrewdly, probably the greatest investor that's ever that's ever lived. Elon Musk went up in an entire Warren Buffett in a single day. So first trillionaire. Yeah. So don't don't tell me that this isn't the frothy ends of the market. And we're at this stage where where the frog is feeling like a hot tub and we're not realizing that the water is about to boil. So Exactly. And so what I would leave there is just simply that just like that chart showed, every IPO at some point draws down close to 50% from its highs over the following year. And we're in a situation where This time it won't be any different. And the thing is, is that therefore, though, I would actually say that while we're really skeptical about the shit now, Kev, to me, the reality is, is this is very much a 2027 story in the grand scheme of things.

Wow, there's going to be gyrations, there's going to be liquidity crunches, there's going to be stuff. There may even be the first reaction to the downside happens this year. But the real consequences of this IPO cycle I think is going to manifest in 2027. And so this is how do you reconcile knowing something now and feeling the urge to, I have to act upon what I know by putting trades on today. versus stepping back and recognizing the real time frame like for instance it's sort of like knowing that there was going to be a crisis in subprime in 2000 and 2006 right and going into 2007 you know and it happened 18 months later and I'm not saying that this is going to be 18 months later but what I'm curious about is just because we recognize it.

What is the actual correct timing of it? Like what is the real what is? Can this be stupid for another six months before? There's an actual actionable moment to to play it the other way and that is why you have to go in and become a big picture trading member All right, let's go Patrick. It's early in

the morning. I want to get back to work, buddy. All right. Yeah. Mark is about to open for you, buddy. Yeah. Anyway, so thank you for tuning in everybody. I appreciate it. Bull market bear markets. It's great for you to spend some time with us on this, right? And I just want to say one thing about YouTube. I just recently found this out. It would be great if you went and subscribed. Everyone knows that. But one of the things I didn't realize is that when you subscribe and you click on the bell, it defaults to this thing called personalized. And the thing about personalized is depending on where you are in the algorithm, you might not show up. I moved all mine from personalized to all. So there's different options when you click on the bell. So don't be just be aware of that. And if you appreciate us, I ask you to go subscribe and to make it on the all section. Listen, thank you for tuning in and we'll see you next week.

Now stick around for the after show. All right. Let me start off by raiding this beer, which I didn't drink. Danny, did you know that? By the way, you probably know that you're a YouTube expert. He didn't know. No, I know about the notification. I don't think it makes a huge difference. No, because I was watching this. I watched this AI lady, Elle, and she was explaining that recently because of some, I think she's implying that She said some things that weren't very positive towards AI and the algorithm has been making it so that she doesn't show up in people's feeds. And she said, one of the things is that if you do a personalized feed, then then it allows Google to choose whether your shows show up. And if you do all, which is what I wanted, I didn't even realize when I subscribed that it was personalized and it wasn't just all.

Like when I subscribed to Patrick, I want to see every one of his posts. Absolutely. I don't want it. I don't want Google deciding if the cigar smoking is worthy of it or not. So, so don't just do it for the market. I'll do it like Patrick years. I know. I'm never going to let you forget that buddy. He'll never forgive me. I know. I know. It was that one. Probably wasn't even you. It's probably Danny. I'm going to write although you would never throw Danny under the bus. You are a very good boss that way. You would take a complete responsibility. It was, it was, it was my Andrew Tate pace. Let's hope you don't have one of those. All right. What do you guys got planned for this week? Dude, I'm, I'm, uh, I'm, uh, by next week, uh,

leaving for, uh, a huge, uh, one month trip through Sardinia, Italy. Nice. In the camper van. Yeah. I'm gonna, I'm gonna set up studio. So the next couple market huddles are going to be, uh, from the islands out there. And I'm going to be enjoying the island. It's going to be awesome. So I literally am designing a full-on workstation studio with full internet and everything. So I'll be on the road and broadcasting is going to be awesome so much for you. We look forward to that. How about you, Danny? What do you have to? This week? Yeah. Pretty boring.

I mean, the sun is shining. The beach is just down the road. So I think you look very like European chic beach. Look, I love it. Like you are like God is surfboard ready. It's a little like Beckham. Like that's with all the tats and the English look and, you know, but also terrible at football. Yeah. Are you don't play did we did win our first game? Oh, you did. Yeah, no, I didn't watch it. I they said it was one of the best games ever. Just saying. Are you impersonating Trump there? Are you serious? I'm not doing that again. But Canada won. Oh, did we win? You know what? I had something else going. So we did win.

Six nothing. Holy shit. Wow. Thank you. Like what? Awesome, man. I don't I don't think but like what like I was like oh listen We're gonna open is this like some junior league like no no we're getting better at soccer slash football is depending on how you want to say it we're We're gonna be a good. We're gonna get yeah, yeah football we're getting better at football, but we like We have a guy that I don't even think our main guy is playing like, I think he's hurt. But he's a superstar on one of the like Spanish teams or somewhere. I'm going to get in trouble for not knowing, but that we have some legitimately good players here. Yeah, like we won six nothing against Qatar. Like I might start watching now. Geez. Well, you know, I was I don't know. I'm torn to a route for Canada or whether I got a route for Ronaldo and Portugal.

That's uh, is he still playing? Yeah. Oh, yeah. He's pretty old. Yeah He's my age Yeah, he's pretty old. Look how old Danny is like it's Danny we're gonna make you a really good-looking statue like he's got in Madeira Yeah, just with the shirt and everything. No, no you've you haven't seen the screwed up statue that they made of them. Yeah, it looks nothing like them.

Yeah, yeah, it looks really bad Okay, listen, I got to get to work. Thanks for everyone. Have a great week. Cheers, everyone.
